White Noise Distribution Theory

Hui-Hsiung Kuo

CRC Press
Boca Raton New York London Tokyo

Contents

1 Introduction to White Noise 1
- 1.1 What is white noise? . . . 1
- 1.2 A simple example . . . 2

2 Background 7
- 2.1 Abstract Wiener spaces . . . 7
- 2.2 Countably-Hilbert spaces . . . 9
- 2.3 Nuclear spaces . . . 11
- 2.4 Gel'fand triples . . . 12

3 White Noise as an Infinite Dimensional Calculus 15
- 3.1 White noise space . . . 15
- 3.2 A reconstruction of the Schwartz space . . . 17
- 3.3 The spaces of test and generalized functions . . . 18
- 3.4 Some examples of test and generalized functions . . . 21

4 Constructions of Test and Generalized Functions 23
- 4.1 General ideas for several constructions . . . 23
- 4.2 Construction from a Hilbert space and an operator . . . 25
- 4.3 General construction of Kubo and Takenaka . . . 27
- 4.4 Construction of Kondratiev and Streit . . . 29

5 The S-transform 31
- 5.1 Wick tensors and multiple Wiener integrals . . . 32
- 5.2 Definition of the S-transform . . . 36
- 5.3 Examples of generalized functions . . . 40

6 Continuous Versions and Analytic Extensions 45
- 6.1 Continuous versions of test functions . . . 45
- 6.2 Growth condition and norm estimates . . . 54
- 6.3 Analytic extensions of test functions . . . 57

7 Delta Functions 61
- 7.1 Donsker's delta function . . . 61
- 7.2 Kubo-Yokoi delta function . . . 67
- 7.3 Continuity of the delta functions . . . 72

8 Characterization Theorems **77**
8.1 Characterization of generalized functions 77
8.2 Convergence of generalized functions 86
8.3 Characterization of test functions 89
8.4 Wick product and convolution 92
8.5 Integrable functions 99

9 Differential Operators **103**
9.1 Differential operators 103
9.2 Adjoint operators 110
9.3 Multiplication operators 113
9.4 Gross differentiation and gradient 116

10 Integral Kernel Operators **121**
10.1 Heuristic discussion 121
10.2 Integral kernel operators 123
10.3 Gross Laplacian and number operator 130
10.4 Lambda operator 136
10.5 Translation operators 138
10.6 Representation theorem 143

11 Fourier Transforms **147**
11.1 Definition of the Fourier transform 147
11.2 Representations of the Fourier transform 153
11.3 Basic properties 155
11.4 Decomposition of the Fourier transform 162
11.5 Fourier-Gauss transforms 164
11.6 Characterization of the Fourier transform 174
11.7 Fourier-Mehler transforms 177
11.8 Initial value problems 184

12 Laplacian Operators **189**
12.1 Semigroup for the Gross Laplacian 189
12.2 Semigroup for the number operator 194
12.3 Lévy Laplacian 199
12.4 Lévy Laplacian by the S-transform 206
12.5 Spherical mean and the Lévy Laplacian 213
12.6 Relationship between Gross and Lévy Laplacians 218
12.7 Volterra Laplacian 224
12.8 Relationships with the Fourier transform 230
12.9 Two-dimensional rotations 232

13 White Noise Integration **239**
13.1 Informal motivation 239
13.2 Pettis and Bochner integrals 241
13.3 White noise integrals 245
13.4 An extension of the Itô integral 253

13.5 Generalizations of Itô's formula 264
13.6 One-sided white noise differentiation 274
13.7 Stochastic integral equations 279
13.8 White noise integral equations 291

14 Feynman Integrals **305**
14.1 Informal derivation 305
14.2 White noise formulation 307
14.3 Explicit calculation 311

15 Positive Generalized Functions **317**
15.1 Positive generalized functions 317
15.2 Construction of Lee 326
15.3 Characterization of Hida measures 331

Appendix A: Notes and Comments **335**

Appendix B: Miscellaneous Formulas **353**

Bibliography **359**

List of Symbols **369**

Index **373**
