ABSTRACT

Effective policy formulation depends on an assessment of the current situation and of recent trends in science and engineering participation rates of all segments of U.S. society. This volume, the sixth in a series, is designed to provide such an assessment. It has been prepared for the Congress, the administration, and others who influence the direction of the U.S. science and engineering effort and who are concerned with maintaining equal opportunity and equal treatment for women and minorities as they participate in this undertaking. The chapters in this book are: (1) Women in Science and Engineering; (2) Education and Training of Women in Science and Engineering; (3) Minorities in Science and Engineering; (4) Education and Training of Minorities in Science and Engineering; and (5) Persons with Physical Disabilities in Science and Engineering. (PR)

# *foreword*

---

The decade of the nineties is already proving to be a challenge for U.S. science and technology. As cold war tensions ease and attention is diverted increasingly to economic and technological competitive arenas, both public and private sector decisionmakers seek detailed information about the supply and quality of human resources available to drive the Nation's science and technology enterprise. It is, after all, the national science and technology enterprise to which we must turn if we are to sustain high societal levels of education, environmental quality, medical research, national security, and technological competitiveness.

It is apparent that not all available human resources are being drawn into that enterprise. Historically women, racial and ethnic minorities, and persons with physical disabilities have been disproportionately represented in science and engineering. Further, they apparently encounter market conditions that may discourage both their entry into and their sustained participation in science and engineering fields.

Effective policy formulation depends on an assessment of the current situation and of recent trends in science and engineering participation rates of all segments of our society. This volume, the sixth in a series, is designed to provide such an assessment. It has been prepared for the Congress, the administration, and others who influence the direction of the U.S. science and engineering effort and who are concerned with maintaining equal opportunity and equal treatment for women and minorities as they participate in this important undertaking.

This report was updated from the 1990 version within the Division of Science Resources Studies (SRS). Patricia E. White, Senior Science Resources Analyst, Education and Human Resources Program (EDU), coordinated the preparation of the report, wrote the text, and compiled data and charts. Donna Fossum (former Acting Deputy Division Director, SRS) prepared the 1992 Status Update. Several SRS staff members provided data, prepared charts, reviewed sections of the manuscript, and assisted in a variety of ways in its production. Special acknowledgment is due John Tsapogas, Science Resources Analyst, Science and Engineering Personnel Program for his review of the manuscript. Mary A. Golladay, Program Director, EDU, and Kenneth M. Brown, Director, SRS, provided overall supervision. Editorial Experts, Inc., provided professional editing services. Patricia Hughes of NSF's Printing Services Branch coordinated the production of the document.

The report has benefited from comments provided by the National Science Foundation's Committee on Equal Opportunities in Science and Engineering.

# 1992 status update

---

## WOMEN AND MINORITIES IN SCIENCE AND ENGINEERING

Today, the majority of the American work force is composed of women and minorities. Their proportion of the workforce is growing steadily. As a result, all occupations and professions—including all fields of science and engineering—must now look increasingly to women and minorities to replenish their stock of trained personnel if they wish to employ American workers.

The direct connection between the activities of scientists and engineers and the ability of the United States to compete technologically in the world economy makes the health of these professions particularly critical determinants of the Nation's future. As a result, U.S. technological competitiveness and the condition of the Nation's human resources in science and engineering cannot be considered separate issues. In a very real sense, the ability of the United States to retain and improve its position as a world economic power depends heavily on the Nation's ability to recruit, train, and retain talented scientists and engineers.

Despite notable increases in recent years, women and minorities continue to be significantly underrepresented among the ranks of the Nation's scientists and engineers in proportion to their numbers in the overall U.S. work force.

- At a time when women constitute 51 percent of the total population and 45 percent of the total work force, they constitute only 16 percent of all scientists and engineers employed in the United States. The pattern for most minorities is similar.
- Although blacks constitute 12 percent of the total population and 11 percent of the total work force, they constitute only 3 percent of all scientists and engineers employed in the United States.
- Although Hispanics constitute 8 percent of the total population and 5 percent of the total work force, they constitute only 2 percent of all scientists and engineers employed in the United States.
- Only for Americans of Asian origin does the pattern change: although this group constitutes 3 percent of the total population and 2 percent of the total work force, it

accounts for 5 percent of all scientists and engineers employed in the United States.

- The lack of reliable data on Native American and disabled scientists and engineers makes it difficult to accurately compare their participation in these professions with their representation in the general work force. However, it appears that they too are underrepresented.

The underrepresentation of women and minorities is most pronounced in fields of engineering and in physical science fields. In the life sciences as well as in the social and behavioral sciences women and minorities now constitute a significant proportion of the membership.

## CAUSES OF UNDERREPRESENTATION

A number of factors contribute to the underrepresentation of women and minorities in science and engineering. Although the choice of occupation is clearly the product of many diverse factors, what is emerging is a picture that includes a progression of events, beginning early in the educational process, that cumulatively operate to divert many women and minorities from educational tracks that lead to careers in science and engineering.

Because of the need for a solid foundation in the basic principles of math and science, the training of America's future scientists and engineers does not begin in graduate or undergraduate school or even high school. It begins in primary school.

On standardized tests of mathematics achievement at the primary school level, boys and girls perform at about the same levels. By high school, however, the performance of young women on math achievement tests falls slightly and thereafter remains slightly lower than that of young men. In science, the trend begins even earlier: the achievement scores of girls are slightly lower than those of boys by the time they are 9 years old and the differences increase at each level.

However, the gap between mathematics scores on standardized tests of male and female high school students has begun to narrow. Over the past decade the scores of young women on the mathematics portion of the Scholastic Aptitude Test (SAT) have increased more rapidly than those of young men,

but in 1991 the average gap between the scores of men and women remains substantial at 44 points. Furthermore, the gap between the SAT mathematics scores of high school men and women persists even when intended college majors are considered (i.e., when aspiring engineers who are women are compared with aspiring engineers who are men). Nevertheless, today's high school women are slightly more likely than high school men to major in a science field in college. In marked contrast, high school men are significantly more likely to choose engineering as a college major than are high school women. Once in college, however, women intending to major in science or engineering are more likely to plan careers in clinical psychology, social work, and law, whereas their male counterparts more often plan careers in engineering and computer programming.

The scores on high school-level standardized mathematics tests of all minorities have increased steadily over the past decade, but with the exception of Asians, the scores of minorities continue to lag significantly behind those of white students. In 1991, the average score of blacks on the mathematics portion of the SAT was 104 points below that of whites (385 versus 489). Similarly, the average score of Native Americans in 1991 was 52 points below that of whites (437 versus 489). The average scores for Hispanics in 1991 fell between those of blacks and Native Americans, and varied somewhat depending on whether the Hispanics were of Mexican, Puerto Rican, or Latin American origin. In marked contrast, the average score of Asians on the mathematics component of the SAT was 41 points higher than that of whites.

The ultimate career goals of minority students planning to pursue college majors in a science or engineering field at 4-year institutions differ markedly from those of their white counterparts. For example, black college freshmen are more likely to aspire to careers in medicine, computer programming, and law than are whites. Asians aspire to careers in engineering and medicine in higher proportions than do whites. Hispanics are more inclined to pursue careers in business management, engineering, law, or medicine than are their non-Hispanic counterparts. In contrast, disproportionate numbers of white freshmen intend to pursue careers in elementary and secondary education. Financial constraints are more likely to deter the educational and career plans of minority students than those of whites. For example, black and Asian college freshmen estimate their parents' income to be lower than that of white students'.

## RECENT PROGRESS IS MIXED

Once in college, women and minorities continue to participate in science and engineering (S&E) programs at lower rates than other groups. During the 1980s, however, the number of women earning baccalaureate degrees in science and engineering increased by 21 percent, while the number of comparable degrees earned by men declined by 1 percent. Women accounted for almost 40 percent of all S&E bachelor's degree

recipients at the end of the decade; almost three-fourths of these women graduates received their degrees in the social sciences, life sciences, or psychology.

Despite the overall gains made by women, the number of degrees earned by women in some fields began to decline by the end of the decade, most notably in the earth, atmospheric and marine sciences and in the physical sciences, as well as in engineering.

At the end of the 1980s, blacks and Asians each accounted for close to 6 percent of all S&E bachelor's degrees conferred. These figures represented an increase in the number of degrees granted to Asians and a decrease in the number granted to blacks over the decade. Hispanics constituted 4 percent of the recipients of S&E bachelor's degrees in 1989, compared with 3 percent of the total a decade earlier. Native Americans accounted for less than one-half of one percent of the S&E baccalaureate degrees conferred at the end of the decade.

By far the most progress in integrating women and minorities into the S&E professions in recent years has occurred in the Nation's graduate schools. Over the past decade, the number of women enrolled in graduate S&E education increased two and one-half times as fast as the number of men (30 versus 13 percent). By 1990, women accounted for almost one-third of the students enrolled in S&E graduate programs. At the same time, Hispanics accounted for between 3 percent and 4 percent of the total, and blacks and Asians constituted 4 percent and 6 percent, respectively, of S&E graduate enrollment.

## THE CHANGING ROLE OF WOMEN AND MINORITIES

During the 1980s, the number of master's degrees in science and engineering earned by women grew by 48 percent, while the number earned by men rose by only 12 percent. At the end of the decade, women received 42 percent of all master's degrees in science and 13 percent of all master's degrees in engineering, or a total of 31 percent of all S&E master's degrees awarded. In contrast, a decade earlier, women received only 26 percent of all S&E master's degrees. During the same decade, the number of S&E doctorates earned by women rose by 63 percent, compared with an increase of only 11 percent for men. As the decade ended, women accounted for 28 percent of all doctorates awarded in science and engineering, in contrast to 21 percent at the beginning of the decade. Eighteen percent of the doctorates awarded to women went to women who were not U.S. citizens, however. When citizenship is taken into account, American women account for 23 percent of all doctorates awarded at the end of the decade. Although the number of women doctorate holders increased in all fields of science and engineering during the 1980s, women's gains were most notable in computer science, where their number grew fivefold, and engineering, where their number quadrupled.

In 1990, blacks, Hispanics, and Asians accounted for over 2 percent, over 3 percent, and 22 percent, respectively, of all

S&E doctorates awarded by U.S. universities. When these figures are adjusted to include only U.S. citizens, however, the percentages of doctorates awarded to blacks, Hispanics, and Asians drops to less than 2 percent, less than 3 percent, and less than 4 percent, respectively. The substantial representation of non-U.S. citizens among minority doctorate recipients obscures the fact that minorities who are U.S. citizens have made only modest gains in achieving doctorates in science and engineering over the past decade. In fact, the number of black U.S. citizens annually receiving doctorates in science and engineering has declined in recent years.

The 1980s witnessed annual increases of 14 percent in the number of women in the ranks of employed scientists and engineers, in marked contrast to a 6-percent annual increase in the number of men entering the same professions. By the end of the decade, women accounted for 1 of every 3 scientists in the Nation, and 1 of every 25 engineers. The representation of women differed considerably by field of science, however, ranging from a low of about 1 of 10 environmental scientists to a high of about 1 of 2 psychologists.

Women scientists and engineers are more likely to be members of minority groups than are their male counterparts. At mid-decade, when this information was last collected, almost 5 percent of women scientists and engineers were black, whereas only about 2 percent of their male counterparts were black. Asian women were found at that time to be overrepresented among women scientists and engineers, compared with their presence in the general work force, by a factor of two; black and Hispanic women were half as likely to be in science and engineering as to be in the general work force.

Asian and Hispanics have patterns of participation in the S&E professions similar to whites while the pattern for blacks was different. For example, 56 percent of Asians, 54 percent of Hispanics and 52 percent of whites were engineers (as opposed to scientists) while 32 percent of blacks were engineers. Among scientists, blacks were more likely than either whites or Asians to be social scientists or psychologists. Hispanics were disproportionately represented in social science and underrepresented as computer specialists.

Because women and minorities have only recently begun to enter the scientific and engineering professions in sizable numbers, the majority of such professionals have fewer years of experience in their particular field than do men and nonminorities. For example, in 1989, approximately three-fifths of female Ph.D.'s employed in science and engineering, compared with one-third of their male colleagues, had fewer than 10 years of professional experience. Almost 50 percent of black Ph.D.'s employed in science and engineering had fewer than 10 years of professional experience, compared with 52 percent of Hispanic, 43 percent of Asian, and 34 percent of white doctoral scientists and engineers. The percentage of all doctoral scientists and engineers with fewer than 10 years' experience was 35 percent.

## PROBLEMS REMAIN

Those women and minorities who do manage to acquire the education necessary to pursue careers in science and engineering occupy secondary roles in these professions in disproportionate numbers. For example, in 1989, when the median salary for employed doctoral scientists and engineers in the United States was \$54,600, the median salary for women in this group was \$9,800 lower. The median salaries for blacks and Hispanics were \$6,100 and \$4,500 lower, respectively. The median salary for Asians was slightly higher than \$54,600. The relative "newcomer" status of women and minority scientists and engineers does not fully explain why members of these groups, with the exception of Asians, are paid less than other groups. In general, women and minority scientists and engineers receive notably lower salaries than do others with similar levels of experience and educational credentials.

Women and minority scientists and engineers, with the exception of Asians, are much more likely than others to be unemployed. The same is true for underemployment: women with doctorates are three times more likely than men with doctorates, and black doctorate holders are twice as likely as white doctorate holders, to hold part-time or non-S&E jobs. Scientists and engineers with disabilities (a group for which there are very limited data) are much less likely than those without disabilities to be in the labor force at any level of participation. Because employees who lack seniority and those who occupy part-time positions are normally the first to be cut during times of economic slowdown, women and minority scientists and engineers may be more adversely affected than others by the current recession.

# introduction

---

The Science and Technology Equal Opportunities Act, passed in December 1980, calls for the National Science Foundation (NSF)

...to promote the full use of human resources in science and technology through a comprehensive and continuing program to increase substantially the contribution and advancement of women and minorities in scientific, professional, and technical careers, and for other purposes.<sup>1</sup>

Under this act, NSF is required to report to Congress on the status of women and minorities in science and engineering (S&E) professions on a biennial basis. This report is the sixth in the series, and, like its predecessors, it provides a comprehensive overview of the participation of women, minorities (including Hispanics), and persons with physical disabilities in S&E employment and training.

The report has been designed as a reference document that allows readers to easily locate information on particular subgroups or specific aspects of participation and utilization. The Status Update provides a concise overview; summary findings are presented in the introductory overviews of each chapter.

The body of the report is organized into three sections.

- Section 1, "Women," contains two chapters, which focus on women in science and engineering. Chapter 1 examines the representation and utilization of women—including members of racial and ethnic minority groups—in science and engineering. Chapter 2 addresses the acquisition of mathematics and scientific skills and highlights differences between the sexes in achievement test performance, academic preparation, and degree attainment.
- Section 2, "Minorities," also contains two chapters. Chapters 3 and 4 present information for minority groups similar to that presented in chapters 1 and 2 for women. This section addresses blacks, Asians, Native Americans, and Hispanics.

- Section 3, "Persons With Physical Disabilities," provides an overview of information about persons with physical disabilities who are in science and engineering.

The areas covered in chapters 1 and 3 relate to employment in science and engineering. They include the following:

- The representation of women and minorities in science and engineering employment.
- Differences in employment characteristics between sexes and across minority groups.
- The underutilization of women and minorities with science and engineering skills.

Labor market representation is assessed by comparing the proportion of employed scientists and engineers who are women and members of minority groups with the proportion of these groups in some relevant population—for example, the overall U.S. employed population or all professional and related workers. Level of representation, however, reveals nothing about the experiences of women and minorities once they are in the labor market. Thus, employment characteristics are included to describe women and minorities in the workforce.

Employment characteristics are analyzed in terms of field and career patterns. Information on field is valuable for at least two reasons:

- To indicate whether women and minorities are underrepresented in some fields vis-à-vis men and the majority.
- To reveal differences by sex and racial/ethnic group.

Employment opportunities vary by field; these differences may be significant in determining variations in work characteristics such as unemployment and salaries. Career patterns are also important because they may illuminate differences in experiences within fields. These patterns are measured in terms of proportion in management positions; for those employed in academia, tenure status and rank are used as indicators.

---

<sup>1</sup> "National Science Foundation Authorization and Science and Technology Equal Opportunities Act," Public Law 960516, 42 USC 1861 (December 12, 1980).

The third issue addressed in the employment chapters is the utilization of individuals with S&E training. Insights in this area may be gleaned from various labor market indicators; labor force participation and unemployment rates are standard measures. These rates are useful in assessing whether market conditions for women and minority scientists and engineers differ from those encountered by men and the majority and also by women and minorities in the general population.

Labor force participation rates measure the fraction of the S&E population in the labor force, that is, the proportion working or seeking employment. Low rates indicate that a significant fraction of those with S&E training and skills are not using these skills in science and engineering or in any other job.

A second indicator of utilization is unemployment. Unemployment rates measure the proportion of those in the labor force who are not employed but who are seeking employment. Higher rates for women and minorities may signify that these groups encounter labor market problems different from those of men and the majority in the S&E work force.

Unemployment rates, however, are incomplete market condition indicators for scientists and engineers. They do not indicate the degree to which those with the necessary education and training succeed in finding S&E jobs. The National Science Foundation has, therefore, developed the S&E underemployment rate. This rate indicates the extent to which scientists and engineers use their training and skills. For example, when full-time jobs are not available, individuals may accept part-time jobs. Similarly, when S&E jobs are not available, some individuals accept jobs in other areas. Thus, some part-time employment (i.e., part-time employment of those seeking full-time jobs) and some non-S&E employment (i.e., employment signifying a belief that S&E jobs are not available) may indicate underemployment. The underemployment rate provides an overall statistical measure of both involuntary part-time and involuntary non-S&E employment.

Observed differences in labor market experiences between women and men and between minorities and the majority highlight possible areas of concern. Although disparities may indicate inequitable treatment, they are not in themselves enough to justify such an inference. Differences may reflect such factors as (1) field and work experience; (2) workers' decisions about the nature of their work involvement; (3) employers' personnel practices in areas such as hiring, training, and promotion; or (4) a combination of these factors that includes, or is a by-product of, inequitable treatment.

The primary source of information about the characteristics of scientists and engineers in the United States is the National Science Foundation's Scientific and Technical Personnel Data

System (STPDS). This system consists of three major components, each designed to measure a particular subpopulation:

1. The Experienced Sample of Scientists and Engineers is a biennial follow-up survey to the *1982 Postcensal Survey of Scientists and Engineers*. The *Postcensal Survey* sample was drawn from those individuals who were in the S&E population at the time of the 1980 census. The most recent survey in this series was conducted in 1989. However, questions about the validity of these data have led to delay in their publication, pending further evaluation.
2. *The Survey of Recent Science and Engineering Graduates* surveys scientists and engineers who earned S&E degrees after the 1980 decennial census was completed. The most recent survey, conducted in 1990, focused on the graduating classes of 1988 and 1989.
3. *The Survey of Doctorate Recipients* is a survey of scientists and engineers who have received their doctorates since 1942. The most recent survey in this series was conducted in 1989.

To produce national estimates, data from the Experienced Sample and *Recent Graduates* surveys are integrated with a computer-based model, the Science and Engineering Tabulating Model (SETAB). Due to the above noted problem with the *1989 Experienced Sample Survey*, the last published national estimates on the population of employed scientists and engineers generated with the SETAB were in 1988. This report accordingly uses the 1988 estimates and 1986 characteristics of the population of employed scientists and engineers, both which were used in the last edition of this report.

Data from the 1989 survey of doctoral scientists and engineers and the 1990 survey of recent college graduates are also presented. In addition, Bureau of Labor Statistics (BLS) figures on employed civilians for 1990 will be used when possible. However, it should be noted that BLS and SETAB figures are not directly comparable, because the former are based on an individual's being employed in a specific occupation, regardless of training. The SETAB required that the individual meet at least two of the following criteria: (1) have a degree in science or engineering, (2) be employed in a science or engineering occupation, or (3) have professional identification as a scientist or engineer, on the basis of education and experience.

Chapters 2 and 4 of this report focus on issues related to education and training, specifically the acquisition of those skills requisite to an S&E career. These issues are of increasing importance for several reasons. The population's chang-

ing demographic mix results in a rate of influx for minorities at all educational levels that is higher than that for whites. As a group, however, minorities do not participate in S&E undergraduate and graduate training to the same extent as do the majority. It is therefore critical to ensure that they have the same opportunities for and access to the (1) acquisition of skills in mathematics and science, and (2) training necessary to meet the nation's need for highly trained S&E personnel.

The education and training chapters explore differences between women and men and between minorities and the majority in four areas of education and training:

- Precollege preparation.
- Undergraduate education.
- Graduate education.
- Postdoctoral experiences.

Most of the data presented in these chapters are from sources outside the NSF. Because these data are not consistently based on regularly recurring surveys, the information that has been presented in previous reports is not always available. Alternative information sources have been substituted where possible.

Scores on standardized tests measuring mathematics and science achievement are used as indicators of participation patterns. For example, students who take fewer years of coursework in mathematics generally score lower on exams measuring mathematical knowledge. Scores on these exams reflect a variety of factors, including social, demographic, and economic characteristics. There is, for instance, evidence linking student performance on standardized tests to family income, and a disproportionate number of minority families are at lower economic levels.

The appendixes of this report contain technical notes (appendix A) and statistical tables (appendix B). The technical notes present information on the underlying concepts, data collection techniques, reporting procedures, and statistical reliability of the primary NSF data sources used in this report.

# women in science and engineering

## DATA IN THIS EDITION

Because no new estimates of the population of employed scientists and engineers are available, the figures for 1988 that were published in the 1990 edition are repeated here. Where appropriate, figures for 1986 are used to provide a general context for reporting information from two new sources: the 1989 survey of doctoral scientists and engineers and the 1990 survey of recent college graduates. In addition, Bureau of Labor Statistics figures on employed civilians for 1990 are used where possible.

## OVERVIEW

An estimated 868,000 women scientists and engineers were employed in the United States in 1988, representing 16 percent of all employed scientists and engineers. However, women were grossly underrepresented in the population of employed scientists and engineers compared with their employment level in the overall U.S. work force. In 1988 they constituted about 45 percent of all workers. Women were more underrepresented among engineers than among scientists; they constituted 4 percent of all engineers and 30 percent of scientists in 1988.

Bureau of Labor Statistics (BLS) figures, which are estimates of the numbers of individuals employed in specific occupations, indicate that in 1990 women still constituted 45 percent of all civilian workers.<sup>1</sup> Women were also underrepresented among those employed as engineers (8 percent), mathematical and computer scientists (36 percent), natural scientists in general (26 percent), and certain categories of natural scientists—biological and life scientists (41 percent), chemists (27 percent), and geologists and geodesists (14 percent). Women were employed as social scientists and urban planners (51 percent) in numbers disproportionate to their numbers in the overall work force.<sup>2</sup> Thus, BLS statistics show the same employment pattern by occupation in 1990 as existed in 1988. Women are underrepresented in science and engineering (S&E) occupations but are more underrepresented among engineers than among scientists (except among social scientists, where they are overrepresented).

Women scientists and engineers are more likely than their male colleagues to be unemployed and underemployed. The

<sup>1</sup> U.S. Department of Labor, Bureau of Labor Statistics, *Employment and Earnings*, vol. 38, no. 1 (Washington, DC: U.S. Government Printing Office, January 1991), table 22, p. 185.

<sup>2</sup> *Employment and Earnings*, vol. 38, p. 185.

unemployment rate for women in S&E fields in 1986 was 2.7 percent, versus 1.3 percent for men. These rates were half the 1976 rates, which were 5.4 percent (women) and 3.2 percent (men). Although the 1986 unemployment rate for women scientists and engineers was well below that for all women in the United States (7.1 percent), it was comparable to the rate for all women college graduates (2.4 percent).

Even though the unemployment rates of women with doctorates and master's degrees in S&E fields are low, they are higher than those of men in these fields. In 1989, women Ph.D.'s had an unemployment rate of 1.7 percent, which was almost three times the 0.6 percent rate for men. Women who received their master's degrees in S&E fields in 1988 and 1989 had an unemployment rate of 2.7 percent in 1990, versus 1.5 percent for men. However, during the same period, women who received baccalaureate degrees in science and engineering had an unemployment rate of 3.3 percent, which was slightly lower than the 3.5 percent rate for men.

Women scientists and engineers were three times as likely as men (6.3 percent versus 1.9 percent) to report being underemployed in 1986. Women with doctorates were also more likely to be underemployed than were their male counterparts. In 1989, their underemployment rate was 2.6 percent; in comparison, the rate for men was 1.0 percent. Overall, these are very low rates.

Women also reported relatively low annual salaries. In 1989, women with doctorates in S&E fields and one year or less of professional experience had a median annual salary of \$35,500, which was 88 percent of that of men (\$40,400). Among recent master's and bachelor's degree recipients in 1990, women also had lower salaries than men. 1988 and 1989 female graduates with S&E master's degrees had a salary of \$32,000, equal to 84 percent of the median salary of male graduates (\$39,000). The yearly median earnings of 1988 and 1989 female graduates who received baccalaureate degrees in science and engineering (\$21,600) were 73 percent of the earnings of men with comparable degrees (\$29,500).

Because of the recent influx of women into science and engineering professions, these women are generally younger and have fewer years of professional experience than men. Almost 60 percent of women, compared with approximately 26 percent of men, reported fewer than 10 years of professional work experience in 1986. In 1989, about 57 percent of

women with doctorate degrees had fewer than 10 years of professional experience; in comparison, 30 percent of the men with doctorates had fewer than 10 years' experience. Only 9 percent of the women, but 31 percent of the men, had 20 years of experience or more.

Relatively few women scientists and engineers are members of minority groups. In 1986, about 5 percent were black, another 5 percent were Asian, and less than 1 percent were Native American. Among men in science and engineering, about 2 percent were black, 5 percent were Asian, and less than 1 percent were Native American. Hispanic women accounted for only a small fraction (3 percent) of all women scientists and engineers; Hispanic men, however, accounted for only 2 percent of all men scientists and engineers. Only Asian women were more highly represented among women scientists and engineers than in the overall work force.

## EMPLOYMENT LEVELS AND TRENDS

In 1988, women constituted 16 percent of the science and engineering (S&E) work force (867,900 out of 5,286,400) (appendix B, table 1). Thus, they represented a smaller proportion of the science and engineering work force than they did of the total U.S. work force. This is also true for employment in professional and related occupations. In 1990, women represented 45 percent of all employed persons<sup>3</sup> and 51 percent of those employed in professional specialty occupations,<sup>4</sup> but only 8 percent of persons employed as engineers.<sup>5</sup> Women's representation among scientists employed in selected fields, although not equal to their representation in the total work force, was much higher. For example, in 1990 women represented 26 percent of persons employed as natural scientists and 36 percent of those employed as mathematical and computer scientists.<sup>6</sup> Furthermore, within the natural sciences, 41 percent of biological and life scientists, 27 percent of chemists, and 14 percent of geologists and geodesists were women. Female urban planners and social scientists, at 51 percent of the total employed in these fields, were overrepresented in relation to their representation in the overall civilian work force.

Women have increased their representation in both the overall work force and the S&E work force over the most recent 10-year period for which data are available. In 1980, women represented 42 percent of the civilian work force; in 1990 this figure was 45 percent.<sup>7</sup> In addition, although women's representation in the S&E work force is still relatively low (16

percent in 1988), it has been increasing: in 1978, only 9 percent of scientists and engineers were women (based on appendix B, table 1).

Women's expanding S&E representation derives from an employment growth rate that substantially exceeded that of men over the last decade. Between 1978 and 1988, the employment of women scientists and engineers rose by 259 percent (14 percent per year) compared with an 87-percent increase for men (6 percent per year) (based on appendix B, table 1).<sup>8</sup>

There has also been substantial growth in the number of women doctoral scientists and engineers who are employed.<sup>9</sup> Figures for 1979 and 1989 show that employment of these women grew by 131 percent (9 percent per year), compared with 32 percent (3 percent annually) for men (based on appendix B, table 3). In 1989, there were approximately 77,000 employed women doctoral scientists and engineers. This number represented 17 percent of the total work force with Ph.D.'s, up from 11 percent (33,400) in 1979.

The number of science and engineering baccalaureate degrees awarded to women<sup>10</sup> increased by 21 percent during 1979-1986 and remained level thereafter, while the number awarded to males rose 8 percent during 1979-1985 then fell 9 percent during 1986-89 (based on appendix B, tables 39 and 40). The number of master's degrees earned by women in 1989 was 48 percent higher than the number received a decade earlier (based on appendix B, table 50). Meanwhile, the number of S&E master's degrees earned by men increased by only 12 percent between 1979 and 1989 (based on appendix B, table 49). Consequently, women accounted for a relatively higher proportion of employed recent science and engineering graduates. In 1990, about 38 percent of employed graduates who were granted an S&E baccalaureate and 29 percent who earned master's degrees in 1988 or 1989 were women (based on appendix B, table 5).<sup>11</sup>

## FIELD<sup>12</sup>

Women represent a much larger proportion of employees in the scientific fields than in engineering (chart 1-1).<sup>13</sup> In 1988, when almost 30 percent of scientists were women, only 4 percent of engineers were women. Among science fields, the

<sup>8</sup> National Science Foundation, *Women and Minorities in Science and Engineering*, NSF 90-301, January 1990, p. 3.

<sup>9</sup> Data on the characteristics of doctoral scientists and engineers in the United States are from the National Science Foundation's Survey of Doctorate Recipients. This survey has been conducted biennially in odd-numbered years since 1973. The most recent survey was conducted in 1989.

<sup>10</sup> See chapter 2, "Education and Training of Women in Science and Engineering," for a discussion of trends in S&E degree production among men and women.

<sup>11</sup> Data are from the National Science Foundation's 1990 Survey of Recent Science and Engineering Graduates, which includes cohorts 1 year and 2 years after graduation. The most recent cohorts were 1988 and 1989.

<sup>12</sup> Information on total scientists and engineers was excerpted from *Women and Minorities*, pp. 4-5.

<sup>13</sup> See appendix A, "Technical Notes," for National Science Foundation S&E field definitions.

SOURCE: Based on appendix B, table 1

representation of women ranged from 11 percent of environmental scientists to 48 percent of psychologists. In engineering, the range was from 3 percent of both mechanical and civil engineers to 8 percent of chemical engineers.

Representation in S&E fields differed dramatically for women and men (table 1-1). Almost half of all women scientists and

engineers were concentrated in psychology or the life and social sciences. A majority of men, on the other hand, were engineers.

These field differences between men and women have changed somewhat since 1978, owing to differing growth patterns in the fields themselves (chart 1-2). The fastest growing science field for both women and men was computer specialties, up 19 percent and 14 percent annually, respectively. In 1988, approximately 25 percent of women and 11 percent of men employed in science and engineering fields were computer specialists, compared with 17 percent and 6 percent, respectively, in 1978. The number of female engineers grew at an annual rate of 16 percent between 1978 and 1988; the number of male engineers increased at an annual rate of 6 percent. In 1988, approximately 14 percent of females employed in S&E fields were engineers, up from 12 percent in 1978. The proportion of males employed in S&E fields dropped from 64 percent in 1978 to 59 percent in 1988.

For both women and men, the fastest growing subfield over the decade was aeronautical/astronautical engineering. Above-average employment increases (16 percent annually) were also registered for women in electrical/electronics and mechanical engineering.

The field distribution differences between women and men scientists and engineers may be summarized by using the

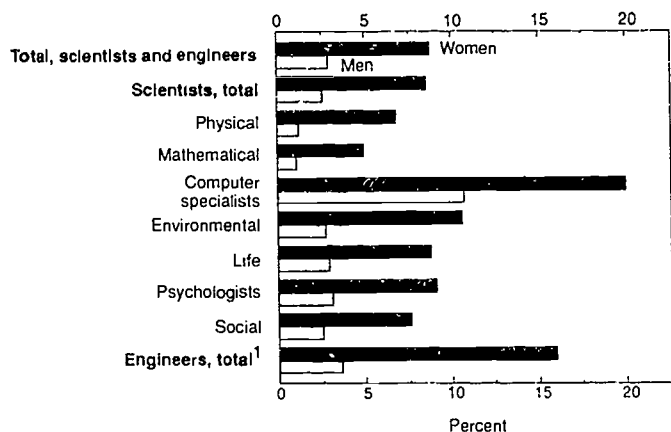

**Chart 1-2. Average annual employment growth rates of scientists and engineers, by field and sex: 1978-88**

<sup>1</sup> No additional engineering subfields are available for 1978.  
 SOURCE: Based on appendix B, table 1

index of dissimilarity.<sup>14</sup> In 1988, the index was 47, signifying that 47 percent of women would have to change fields to have a distribution identical to that of men. If the science and engineering work forces are considered separately, the index is 24 in the science work force and 23 in engineering. Since 1978, these indexes have not changed substantially.

**Chart 1-3. Average annual employment growth rates of doctoral scientists and engineers, by field and sex: 1979-89**

<sup>1</sup> Because the number of doctoral women engineers is small (1,790), growth rates for engineering subfields are not presented.  
SOURCE: Based on appendix B, table 3

Among doctoral scientists and engineers, growth rates for women and men have also varied considerably by field (chart 1-3). Employment of women Ph.D.'s in the sciences rose at an annual rate of 9 percent between 1979 and 1989, compared with 3 percent for men. The most rapid growth for women occurred in those fields where the number of employed women was relatively low in 1979. For example, the number of women doctoral computer specialists rose from about 370 in 1979 to 2,300 in 1989 (an average annual growth rate of 20 percent), and the number of women doctoral engineers rose from about 500 to 2,300 (an average of 16 percent per year).

The above-average growth rates in these two fields mirrored trends in degree production. The number of doctorates granted to women in engineering in 1989 (373) was 502 percent higher than the number granted in 1979 (62) (based on appendix B; table 54). This rate of increase in female Ph.D.'s

in engineering was much greater than the increase in all of the major science fields. The major science fields (and their rates of growth) include computer science (296 percent), physical sciences (111 percent); mathematics (31 percent); earth, atmospheric, and oceanographic sciences (151 percent); agricultural and biological sciences (71 percent); psychology (43 percent); and social sciences (25 percent).

Employed women and men scientists and engineers with doctorates have widely different distributions by field (chart 1-4). Of these Ph.D.'s, more women (97 percent) than men (80 percent) were scientists in 1989. Over 80 percent of women Ph.D.'s were life scientists (34 percent), psychologists (28 percent), or social scientists (19 percent). Men with doctorates were concentrated in the life sciences (24 percent), engineering (20 percent), and physical sciences (17 percent). Within engineering, women were most likely to be electrical/electronics engineers (19 percent) in 1989; this was also true for men (20 percent).

Not surprisingly, the index of dissimilarity for doctoral scientists and engineers was 32 in 1989—24 for scientists and

**Chart 1-4. Employed doctoral scientists and engineers, by field and sex: 1989**

SOURCE: Based on appendix B, table 3

<sup>14</sup> U.S. Commission on Civil Rights, *Social Indicators of Equality for Minorities and Women* (Washington, DC: U.S. Government Printing Office, August 1978), p. 44. The index of dissimilarity is calculated by taking the difference between two percentage distributions (one for each group, and each totaling 100 percent) covering the same occupation. The sum of the absolute (disregarding the sign) difference for all occupations is divided by two and the result is the index of dissimilarity. "The index ... represents the percentage of a group who would have to change occupations in order for the group to have the identical distribution of a comparison group. If two groups had the same distribution of occupations, the index of dissimilarity would be 0."

only 8 for engineers. The index has not changed much over the decade. In 1979 it was 33—25 for scientists and 8 for engineers.

## EXPERIENCE

Employment of women scientists and engineers increased relatively more rapidly over the decade from 1978 to 1988 than did the employment of men. Thus women scientists and engineers, on average, are younger and have fewer years of professional experience than their male colleagues. In 1986, almost 60 percent of women scientists and engineers—compared with slightly more than 25 percent of men—had fewer than 10 years of professional experience. Only 15 percent of women, but 30 percent of men scientists and engineers, had 20 or more years of work experience (based on appendix B, tables 7 and 8).<sup>15</sup>

Years of work experience for women vary among S&E fields. For example, in engineering—a field that has seen a considerable increase in the employment of women—almost 68 percent of women had fewer than 10 years of professional work experience in 1986. In science fields overall, about 56 percent of women reported fewer than 10 years of work experience.<sup>16</sup>

Doctoral women scientists and engineers also have less work experience than do doctoral men (chart 1-5). In 1989, the proportion of women with fewer than 10 years of work experience since receiving their doctorates was 57 percent, versus 30 percent for men. The proportion of doctoral scientists and engineers with 20 years or more of professional experience was 9 percent for women and 31 percent for men (based on appendix B, tables 10 and 11).

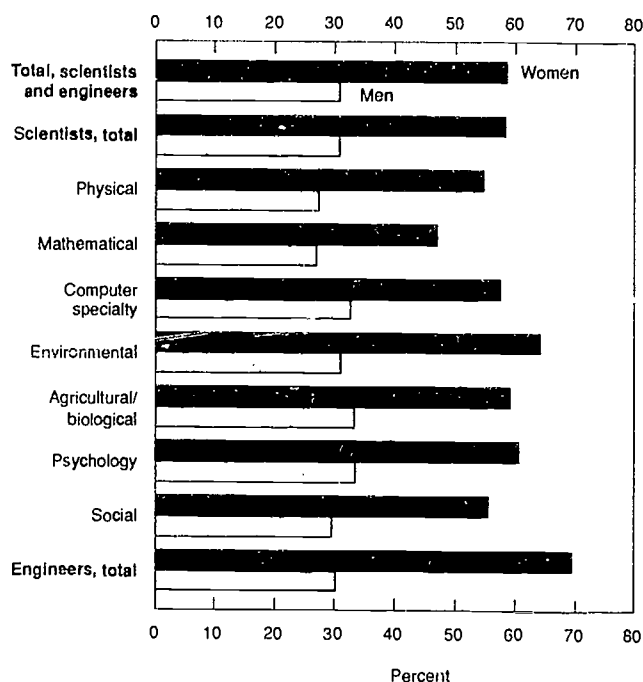

## CAREER PATTERNS

Because there are no direct measures of career development for scientists and engineers, indirect measures are substituted. One such indicator is the proportion of scientists and engineers in management—especially management of research and development activities. Because no more recent data are available, findings from 1986 will be highlighted, supplemented by information on the tenure status and faculty rank of doctoral scientists and engineers in academia.

### Management<sup>17</sup>

Of scientists and engineers reporting a major work activity, 19 percent of women—compared with 29 percent of men—reported management (general and of R&D) as their major work activity. Among engineers, 13 percent of women and 31 percent of men reported that they were engaged in manage-

**Chart 1-5. Percentages of doctoral women and men with fewer than 10 years of work experience, by field: 1989**

SOURCE: Based on appendix B, tables 10 and 11

ment activities. Within the engineering subfields, the proportions of women reporting management as their primary work activity ranged from 6 percent of petroleum engineers to 17 percent of industrial engineers. The range for men was from 21 percent of petroleum engineers to 37 percent of civil engineers.

Among scientists, 20 percent of women, compared with 27 percent of men, reported management as their primary work activity. This difference was small in some fields. For example, about 33 percent of women social scientists—compared with 37 percent of men—reported management as their major work.

### Tenure Status and Academic Rank

Among doctorate-level scientists and engineers employed in 4-year colleges and universities, women are less likely than men to be tenured or to hold full professorships (table 1-2). In 1989, about 36 percent of women Ph.D.'s were tenured, compared with 59 percent of men Ph.D.'s. However, the younger age and fewer years of professional experience accounts for some of this difference. In 1989, 39 percent of employed female doctoral S&E were under 40 years old; 25 percent of the men were in the same age category.<sup>18</sup>

<sup>15</sup> Women and Minorities, p. 6.

<sup>16</sup> Women and Minorities, p. 6.

<sup>17</sup> See Women and Minorities, pp. 6-7, for additional details on this topic. Figures are based on Appendix B; tables 13-15.

In 1989, a smaller proportion of doctoral women (70 percent) than men (84 percent) held professorial rank (i.e., full, associate, or assistant professor) in 4-year colleges and universities. Among those with professorial rank, women were much less likely than men to hold full professorships and more likely to hold assistant professorships. Since 1979, however, progress has been made by women. The number of women Ph.D.'s who were full professors in 1989 (7,348) was 185 percent higher than the number in 1979 (2,576); the increase for men was 73 percent (from 47,791 in 1979 to 82,857 in 1989).<sup>19</sup>

**Table 1-2. Doctoral scientists and engineers in 4-year colleges and universities, by tenure status, academic rank, and sex: 1989 [Percentages]**

## LABOR MARKET INDICATORS

Labor market indicators<sup>20</sup> such as salaries and unemployment rates are useful in assessing the relative success which women and minorities have achieved in the labor market. However, the existence of disparities between groups does not prove or disprove the existence of discrimination in the labor market. Differences in salaries and various measures of employment status may reflect inequitable treatment; or a number of factors including field distributions, experience levels, employment sectors, labor market behavior; or a combination of both.

### Labor Force Participation Rates<sup>21</sup>

The labor force participation rates for men and women scientists and engineers were approximately equal (95 percent and 94 percent, respectively) in 1986 (appendix B, table 21). These rates were higher than those for both the population in

general and the college-educated population in particular. In 1986, about 55 percent of all women age 16 or older and 76 percent of men were in the labor force. For college-educated individuals, the corresponding rates were 73 percent and 88 percent, respectively.<sup>22</sup>

BLS figures show similar overall labor force participation rates in 1990. For example, about 58 percent of all women age 16 or older and 76 percent of all men were in the labor force.<sup>23</sup> College-educated women had a 75-percent participation rate and college-educated men an 88-percent rate.<sup>24</sup>

Labor force participation rates varied for women among S&E fields in 1986. Within science fields, rates for women ranged from 90 percent of life scientists to 97 percent of computer specialists; in engineering, the range was from 90 percent of chemical and electrical/electronics engineers to 99 percent of aeronautical/astronautical engineers. However, the overall rate for women scientists was the same as that for women engineers—94 percent.

Women and men scientists and engineers (who received their Ph.D.'s between 1946 and 1988) participated in the labor force at the same rate (93 percent) in 1989 (appendix B, table 22). Both sexes had participation rates of about 93 percent in science fields. However, within science fields, rates for women ranged from 89 percent for physical scientists to 99 percent for computer specialists. Similarly, men's rates ranged from 91 percent for physical scientists to 99 percent for computer scientists. Rates for doctoral engineers were slightly higher for women (98 percent) than men (96 percent).

Among recent college graduates, women with bachelor's degrees in science fields participated in the labor force to a lesser degree (96 percent) than did men (98 percent) (appendix B, table 23). This was true of graduates with degrees in all science fields except the social sciences and environmental sciences, in which the rates were about the same. Rates for graduates with degrees in engineering were 98 percent for women and 99 percent for men.

Recent female graduates with master's degrees in science fields also participated in the labor force at a lower rate than males (94 percent versus 99 percent). For women, rates ranged from 89 percent in the social sciences to 100 percent in the environmental sciences; rates for men ranged from 98 percent in the social and life sciences to 100 percent in psychology and the environmental sciences. Of those with master's degrees in engineering, 93 percent of women and 98 percent of men were in the labor force.

<sup>19</sup> National Science Foundation, *Characteristics of Doctoral Scientists and Engineers in the United States: 1989*, NSF 91-317, table 31, p. 36.

<sup>20</sup> Figures for 1989 are from appendix B, tables 19 and 20; figures for 1979 are from National Science Foundation, *Characteristics of Doctoral Scientists and Engineers in the United States: 1979*, NSF 80-323, p. 7.

<sup>21</sup> See appendix A, "Technical Notes," for definitions of the labor market rates used in this report.

<sup>22</sup> Information for all scientists and engineers is excerpted from *Women and Minorities*, p. 8.

<sup>23</sup> Data on labor force participation rates for the general population are from *Employment and Earnings*, p. 157. Rates for the college-educated population are from the U.S. Department of Labor, Bureau of Labor Statistics, unpublished tabulations.

<sup>24</sup> *Employment and Earnings*, vol. 38, p. 164.

<sup>25</sup> U.S. Department of Labor, Bureau of Labor Statistics, unpublished tabulations.

Women and men scientists and engineers who do not participate in the labor force differ in their reasons for nonparticipation. In 1986,<sup>25</sup> about 34 percent of women who were nonparticipants in the labor force reported family responsibilities ("keeping house") as their primary reason; less than 1 percent of men gave this reason. Women also were more likely than men to report that they were outside the labor force because they were students ("going to school") (35 percent versus 15 percent). On the other hand, over 75 percent of men—and fewer than 15 percent of women—said that they were retired.

The reasons given for nonparticipation were different for women scientists and engineers than for all women. In 1986, about 67 percent of all women cited family responsibilities, 14 percent were retired, and 8 percent were students.<sup>26</sup>

Similarly, BLS statistics for 1990 show that 55 percent of all women cited family responsibilities as their reason for not participating in the labor force.<sup>27</sup> Eighteen percent gave retirement as their reason for not being in the labor force, and 8 percent were students. Of men nonparticipants, 52 percent cited retirement; 15 percent, student status; 12 percent, disability; and 2 percent, family responsibilities.

### Unemployment Rates<sup>28</sup>

Although women and men scientists and engineers participate in the labor force at approximately the same rate, women have a higher unemployment rate than do men. In 1986, the rate for women was more than twice that for men—2.7 percent versus 1.3 percent (appendix B, table 21). Unemployment rates, however, had fallen for both women and men over the decade since 1976, when the rates were 5.4 percent and 3.2 percent, respectively.

The 1986 unemployment rate for women scientists and engineers was considerably lower than the rate for all women in the United States (7.1 percent),<sup>29</sup> but was comparable to both the rate for women in professional occupations (2.3 percent)<sup>30</sup> and the rate for women college graduates (2.4 percent).<sup>31</sup>

Unemployment rates by sex vary both between and within science and engineering fields. In all science fields, unemployment rates for women were higher than those for men in 1986. The largest difference was between women and men environmental scientists (8.2 percent versus 3.9 percent). At the other extreme, unemployment rates for women (2.7 percent) and

men (2.3 percent) social scientists were quite similar (appendix B, table 21). The lowest rates for both women and men were reported by computer specialists in 1986 (1.6 percent and 0.6 percent, respectively).

Within engineering fields, with one exception, unemployment rates for women were higher than those for men. In 1986, the unemployment rate for women electrical/electronics engineers (1 percent) was approximately equal to that for men.

The unemployment rates of doctoral scientists and engineers, both women and men, are lower than those of all scientists and engineers. However, rates for doctoral women were higher than those of their male colleagues in all S&E fields. In 1989, the unemployment rate for women with doctorates (1.7 percent) was almost three times that for men (0.6 percent) (chart 1-6a).

Between 1979 and 1989, the unemployment rate declined from 2.4 percent to 1.7 percent for doctoral women, but remained essentially the same for men (0.7 percent in 1979 and 0.6 percent in 1989). In 1989, within fields, women with doctorates had consistently higher unemployment rates than did men with doctorates (chart 1-6a).

Chart 1-6a. Unemployment rates of doctoral scientists and engineers, by sex and field: 1989

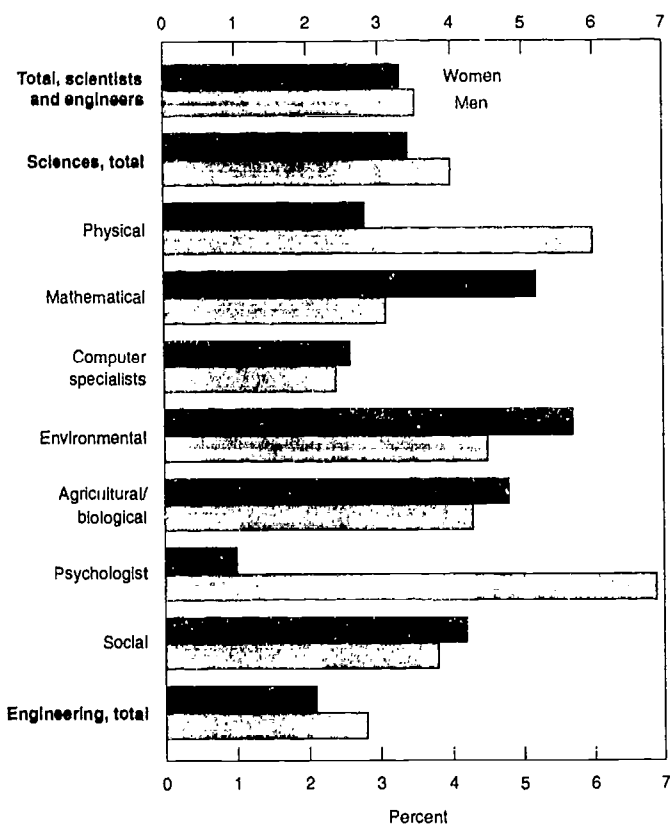

SOURCE: Appendix B, table 22

<sup>25</sup> Findings for 1986 are from *Women and Minorities*, p. 8.  
<sup>26</sup> U.S. Department of Labor, Bureau of Labor Statistics, *Employment and Earnings*, vol. 34, no. 1 (Washington, DC: U.S. Government Printing Office, January 1987), p. 197.  
<sup>27</sup> *Employment and Earnings*, vol. 38, p. 204.  
<sup>28</sup> Information on 1986 rates is from *Women and Minorities*, p. 8.  
<sup>29</sup> *Employment and Earnings*, vol. 34, p. 168.  
<sup>30</sup> *Employment and Earnings*, vol. 34, p. 168.  
<sup>31</sup> U.S. Department of Labor, Bureau of Labor Statistics, unpublished tabulations.

Unemployment rates for recent recipients of S&E degrees are similar for women and men at the baccalaureate level, but are much higher for women at the master's degree level. For those who obtained their bachelor's degrees in 1988 or 1989, unemployment rates in 1990 were 3.5 percent for men and 3.3 percent for women (chart 1-6b). Also, unemployment rates for women were lower than those for men in psychology, physical sciences, and engineering.<sup>32</sup> For recent S&E master's degree recipients, the rate for women (2.7 percent) was higher than that for men (1.5 percent) (chart 1-6c).

**Chart 1-6b. Unemployment rates of S&E bachelor's recipients, by sex and field: 1990**

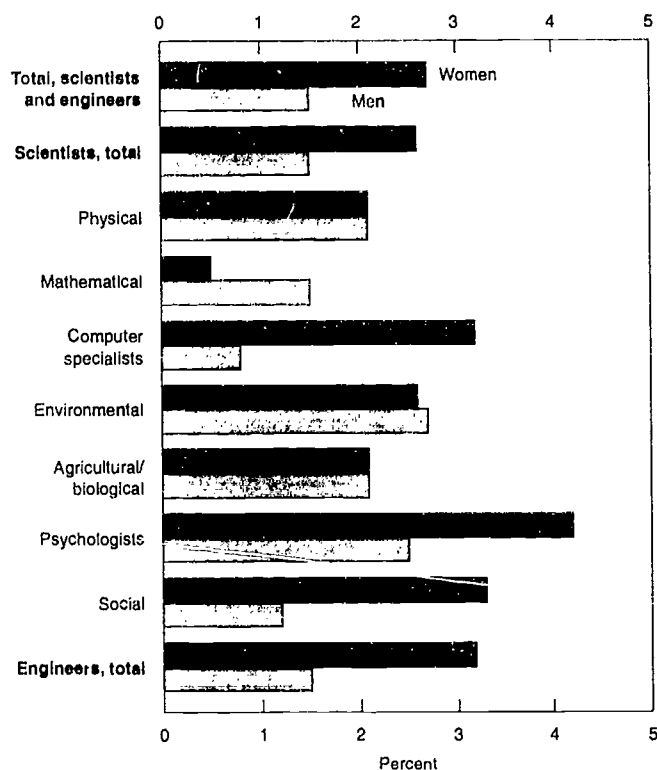

SOURCE: Appendix B; table 23

### S&E Underemployment Rates<sup>33</sup>

The S&E underemployment rate is one measure of underutilization among employed scientists and engineers.<sup>34</sup> For women scientists and engineers, this rate was approximately three times that for men in 1986 (6.3 percent versus 1.9 percent) (appendix B, table 21). The rates were higher for women in almost all major fields of science and engineering.

**Chart 1-6c. Unemployment rates of S&E master's recipients, by sex and field: 1990**

SOURCE: Appendix B, table 23

The greatest differences occurred in science fields, in which the underemployment rate was 7.0 percent for women and 3.3 percent for men. Only among computer specialties did women and men report the same rate—2.5 percent. In engineering, women had an underemployment rate of 2.3 percent, compared with 1.0 percent for men.

Although S&E underemployment rates among doctoral scientists and engineers were lower than those for all scientists and engineers, the rate for women was still higher than that for men (chart 1-7). In 1989, these rates were 2.6 percent for women and 1.0 percent for men. Among women, underemployment rates were higher for scientists (2.7 percent) than for engineers (1.0 percent). The rates for men were 1.1 percent for scientists and 0.5 percent for engineers. By field, underemployment was highest for social scientists for both women (5.2 percent) and men (2.1 percent) (appendix B, table 22).

### Salaries

Average annual salaries of women scientists and engineers are lower than those of men. This difference may stem from differences in degree fields, degree levels, experience levels, employment sectors, labor market behavior, or a combination of these variables.

<sup>32</sup> National Science Foundation, Science Resources Studies Division, Characteristics of Recent Science and Engineering Graduates: 1990 (forthcoming, 1992).

<sup>33</sup> Information for 1986 is excerpted from Women and Minorities, p. 7.

**Chart 1-7. Underemployment rates of doctoral scientists and engineers, by sex and field: 1989**

SOURCE: Based on appendix B, table 22

In 1986, the average annual salaries of women scientists and engineers were about 75 percent of men's salaries.<sup>35</sup> In 1990, the median annual salary for women who had received S&E bachelor's degrees in 1988 or 1989 was \$21,600, about 73 percent of the \$29,500 median salary of men (chart 1-8). For recent master's S&E degree recipients in 1990 (degree granted in 1988 or 1989), the ratio was 84 percent (\$32,800 for women versus \$39,000 for men). In 1989, among doctorates with one year or less of professional experience, the median salary for women (\$35,500) was 88 percent of the median salary for men (\$40,400). In comparison, ratios of women's salaries to men's in the overall work force in 1990 (based on median weekly earnings) were 73 percent for all full-time wage and salary workers over age 25,<sup>36</sup> 74 percent for full-time wage and salary workers in professional occupations,<sup>37</sup> and 89 percent for full-time wage and salary engineers.<sup>38</sup>

In 1986, salaries for women were lower than those for men in all S&E fields.<sup>39</sup> Among scientists, salaries for women

averaged 75 percent of those for men (based on appendix B, table 24). This difference was partially due to the relatively low salaries earned by individuals in psychology, the life sciences, and the social sciences. In the computer specialties—the fastest growing field for both women and men during the eighties—women's salaries averaged about 85 percent of those for men. For engineers, the salary differential was 83 percent, with some fluctuations among major engineering fields.

Women doctoral scientists with one year or less of professional experience earned 96 percent of what men earned (\$35,200 versus \$36,700) and engineers 98 percent (\$47,700 versus 48,500) (chart 1-8). By field, the differential for doctoral scientists ranged from 89 percent (environmental sciences) to 104 percent (psychology—appendix b; table 73).

**Chart 1-8. Women salaries as a percentage of men's salaries, by field and level of degree**

NOTE: Percentages for bachelor's and master's degrees are based on the 1990 salaries of 1988 and 1989 graduates; percentages for doctorates are based on 1989 salaries of Ph.D.'s with 1 year or less of professional experience

SOURCE: Appendix B; based on table 26 and 72.

In 1990, the median salary of women who had received baccalaureates in 1988 and 1989 in engineering was 2 percent higher (\$33,800) than the salary of men (\$33,000—chart 1-8). Women with degrees in science fields earned a median salary which was 20 percent less than that of men (\$20,100 versus \$29,500). However, this lower salary was partly due to the lower salaries of females in life sciences, social sciences and psychology where women's salaries were approximately 85 percent of men's salaries (appendix B, table 26). In all other

<sup>34</sup> See appendix A, "Technical Notes," for the definition of underemployment rate.

<sup>38</sup> Employment and Earnings, vol. 38, p. 223.

<sup>39</sup> This paragraph excerpted from Women and Minorities, p. 10.

<sup>40</sup> Women and Minorities, pp. 10-11.

fields of science, women's salaries were within 5 percent of men's salaries.

At the master's degree level, women who graduated with degrees in science fields in 1988 and 1989 earned 88 percent of the median annual salary earned by their male colleagues in 1990 (\$31,200 versus \$35,400). Women with degrees in engineering earned a median salary (\$40,100) equal to 96 percent of the salary of men (\$42,000). In three fields, physical science, mathematics and psychology, women salaries were more than 10 percent below men's salaries.

## MINORITY WOMEN

The following section focuses first on racial minorities (blacks, Asians, and Native Americans) and then on Hispanics. Data presented are limited by the small sample sizes for many of the racial/ethnic groups. The latest data available for all scientists and engineers in the United States are for 1986 and are excerpted from the 1990 edition of this report.<sup>40</sup>

### Racial Minorities

#### *Employment Levels and Trends*

Racial minorities account for a larger proportion of employed women scientists and engineers than of men scientists and engineers. In 1986, about 10 percent of women scientists and engineers were members of racial minority groups (blacks, Asians, or Native Americans), compared with 7 percent for men.

The racial distribution of women scientists and engineers in 1986 was 87 percent white (608,900), 5 percent black (34,500), 5 percent Asian (36,300), and less than 1 percent Native American (2,700).<sup>41</sup> The remaining 2 percent were of mixed racial background or did not report their race. Among men scientists and engineers, about 2 percent were black, 5 percent were Asian, and less than 1 percent were Native American.

In 1986, black women accounted for 11 percent of all employed women in the United States,<sup>42</sup> compared to 5 percent of women in the S&E work force. On the other hand, Asians were more highly represented among women scientists and engineers (5 percent) than among all women in the general work force (2 percent).<sup>43</sup>

Among employed doctoral scientists and engineers, 7,747 women (10 percent of all employed women with doctorates) were members of racial minority groups in 1989 (based on appendix B; table 4). About 3 percent (2,236) of the women

Ph.D.'s employed as scientists and engineers were black, 7 percent (5,328) were Asian, and 0.2 percent (183) were Native American. The comparable figures for men were 1.3 percent (4,954) black, 9.7 percent (35,911) Asian, and 0.2 percent (589) Native American.

In 1979, approximately 9 percent of all employed female doctoral scientists and engineers were members of racial minority groups. Although the numbers increased between 1979 and 1989, the pattern of minority representation was similar in both years. Of all employed female doctoral scientists and engineers in 1979, 2.4 percent (785) were black, 6.1 percent (2,028) were Asian, and 0.4 percent (117) were Native American.<sup>44</sup>

### Field

In 1986, Asian women were more likely to be engineers than were other racial minority women. About 20 percent of Asian women were engineers; of women in other racial groups, between 11 percent (Native American) and 14 percent (white) were engineers.<sup>45</sup> This pattern holds for employed women doctoral scientists and engineers in 1989 (table 1-3). Employed Asian women with Ph.D. degrees are more likely to have doctorates in engineering (9 percent) than are Native Americans (7 percent), blacks (2 percent), or whites (3 percent). Furthermore, Asian women tend to have doctorates in the life sciences (42 percent) more often than do blacks (29 percent) or whites (34 percent).

**Table 1-3. Field distribution of women doctoral scientists and engineers, by racial group: 1989 [Percentages]**

Field	Total	White	Black	Asian	Native American
Scientists, total	97	97	98	91	93
Physical	8	7	4	18	10
Mathematical	2	2	2	5	1
Computer specialists	3	3	--	5	1
Environmental	2	2	--	2	1
Life	34	34	29	42	38
Psychologists	28	30	35	9	25
Social	19	19	28	11	17
Engineers, total	3	3	2	9	7

Double dashes (--) represent too few cases to estimate.  
NOTE: Details may not add to total because of rounding.  
SOURCE: Based on Appendix B, table 4

### Experience

Across all racial groups, more women than men scientists and engineers have fewer than 10 years of work experience. Among women, white and Asian scientists and engineers were more likely than blacks to report fewer than 10 years' professional experience in 1986 (about 58 percent each for whites and Asians, compared with 52 percent for blacks).<sup>46</sup>

<sup>41</sup> Data for Native Americans should be viewed with caution, because the estimates are based on an individual's own classification with respect to Native American heritage; such perceptions may change over time.

<sup>42</sup> Employment and Earnings, vol. 34, pp. 158-160.

<sup>43</sup> U.S. Bureau of the Census, Detailed Occupation and Years of School Completed by Age for the Civilian Labor Force by Sex, Race, and Spanish Origin: 1980, Supplementary Report #PC 80-SI-8, 1980 Census of the Population (Washington, DC: U.S. Government Printing Office, 1983), p. 7.

<sup>44</sup> Figures for 1979 are from Characteristics of Doctoral Scientists and Engineers: 1979, p. 7.

<sup>45</sup> Women and Minorities, p. 11.

<sup>46</sup> Women and Minorities, p. 11.

Black female scientists and engineers with doctorates were more likely to report fewer than 10 years of professional experience than were white or Asian women with S&E doctorates. In 1989, approximately 62 percent reported 10 or fewer years of professional experience, whereas 57 percent of white and 56 percent of Asian women did the same (based on appendix B, table 11).

### **Career Patterns**

The proportion of women scientists and engineers who reported management as their primary work activity varied among racial groups. In 1986, black women were most likely to be primarily engaged in management activities (24 percent), followed by Asian women (22 percent) and white women (19 percent). Within all racial groups, lower proportions of women than men reported management as their major work.<sup>47</sup>

Other indicators of career patterns are tenure status and academic rank. In 1989, black women with doctorates were more likely (68 percent) to be in tenure-track positions—either tenured or waiting for tenure—than were white women (58 percent) or Asian women (42 percent) with doctorates (based on appendix B, table 17). Of those who were in tenure-track positions, the proportions tenured varied, with blacks (59 percent) less likely to be tenured than were whites (63 percent) but slightly more likely than Asians (57 percent).

Differences also exist in terms of the academic rank of doctoral women scientists and engineers within racial groups. In 1989, more white (19 percent) than Asian (16 percent) or black (15 percent) women held full professorships. Blacks were more likely to be at the assistant professor level (35 percent, compared with 28 percent of whites and 27 percent of Asians) (based on appendix B, table 20).

### **Labor Market Indicators**<sup>48</sup>

The labor force participation rates of women scientists and engineers vary only slightly among the racial groups. In 1986, participation rates ranged from a low of 93 percent for Asian women to a high of 97 percent for Native Americans (appendix B, table 21).<sup>49</sup>

Although variation among racial groups was not large, whites earned the highest average annual salaries among women scientists and engineers. In 1986, white women scientists earned an average of \$29,400, compared with \$28,800 for Asian women scientists and \$25,400 for black women scientists (appendix B, table 24). Among engineers, Asian women earned the highest annual salary—an average of \$35,000 in 1986. Comparable salaries for white women engineers and black women engineers were \$34,300 and \$32,900, respectively.

At the doctoral level in 1989, black (96 percent) and Asian (95 percent) women participated in the labor force at slightly higher rates than did whites or Native Americans (93 percent) (appendix B, table 22). However, Asian women again had the highest median salaries—\$45,800 compared with \$44,700 for white women, \$44,400 for black women, and \$43,500 for Native American women (appendix B, table 25). No differences were more than 10 percent.

Regardless of racial group, all women scientists and engineers reported median annual salaries lower than those of men. The differential between the salaries of Asian women and Asian men was the largest. In 1986, Asian women earned salaries equal to 74 percent of Asian men's salaries, black women's median salaries were equal to 78 percent of black men's salaries, and white women's salaries were equal to 76 percent of white men's salaries.<sup>50</sup>

Among doctoral scientists, the differences between women's and men's salaries were not as large. In 1989, black women's salaries were 87 percent of black men's salaries, Asian women's were 82 percent of Asian men's, and white women's were 79 percent of white men's (based on appendix B, table 25).

### **Hispanics**<sup>51</sup>

Hispanics are a diverse ethnic group; they include individuals of Spanish heritage from Central and South America, Asia, and Europe. In 1986, about 23 percent (4,600) of Hispanic women scientists and engineers were Mexican American, 30 percent (5,800) were Puerto Rican, and 45 percent (8,900) were classified as "other Hispanic"; the remainder (300) did not report their Hispanic origins. It would be desirable to differentiate among them because each of these groups may face different experiences in the S&E work force. Because of data limitations, however, Hispanics are treated in the aggregate.

### **Employment Levels and Trends**<sup>52</sup>

Almost 3 percent (19,600) of women scientists and engineers in 1986 were Hispanic, compared with about 2 percent of men scientists and engineers (based on appendix B, table 2). The proportion for women was up from 2 percent (9,500) in 1982 (the earliest year for which comparable data are available). Among doctoral women scientists and engineers, Hispanics accounted for 2.2 percent (1,682) of those employed in 1989 (appendix B, table 4). Female Hispanic representation in the overall U.S. work force in 1990 was 3 percent.<sup>53</sup>

<sup>47</sup> Women and Minorities, p. 11.

<sup>48</sup> Because of small sample sizes for women scientists and engineers by racial/ethnic group, data on unemployment and underemployment are not reliable and therefore are not presented.

<sup>49</sup> Women and Minorities, p. 11.

<sup>50</sup> Women and Minorities, p. 11.

<sup>51</sup> Information for 1986 is from Women and Minorities, p. 12.

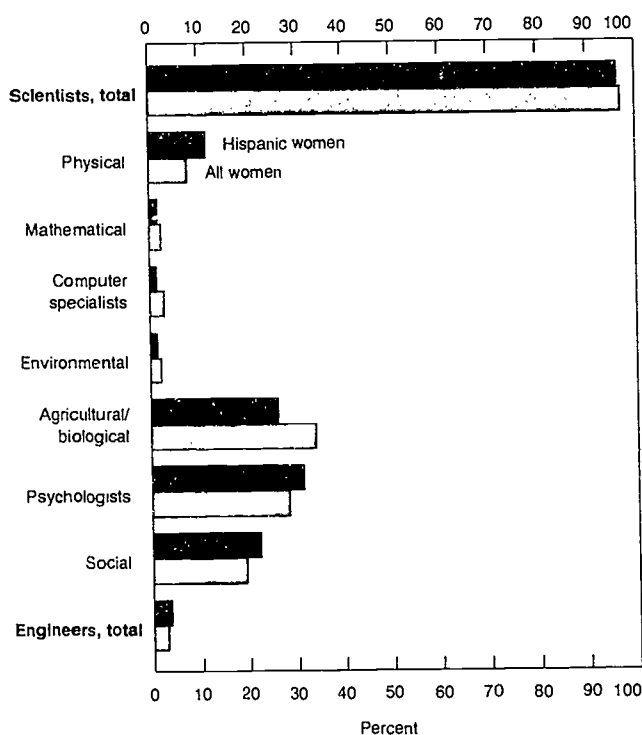

<sup>52</sup> Information for 1986 is from Women and Minorities, p. 12.

<sup>53</sup> Employment and Earnings, vol. 38, p. 208.

## Field

In general, the S&E field distributions of Hispanic women and all women were fairly similar in 1986. However, Hispanics were more likely to be life scientists (21 percent versus 15 percent) and relatively less likely to be computer specialists (15 percent versus 22 percent).<sup>54</sup> In 1989, 32 percent of employed Hispanic female Ph.D.'s were psychologists; of other female Ph.D.'s, 28 percent were psychologists (chart 1-9). The lowest percentages of Hispanic female Ph.D.'s were in computer science (1 percent), environmental science, (2 percent), or mathematics (2 percent) (appendix B, table 4).

**Chart 1-9. Field distribution of employed doctoral scientists and engineers—Hispanic women and all women: 1989**

SOURCE: Based on appendix B, table 4

## Experience

Hispanic women scientists and engineers have substantially fewer years of professional work experience than do all women. In 1986, almost 75 percent of Hispanics—compared with about 59 percent of all women—had fewer than 10 years' experience.<sup>55</sup> Among women with S&E doctorates, 70 percent of Hispanics had fewer than 10 years of professional experience in 1989, compared with 57 percent for all women with S&E doctorates (based on appendix B, table 11).

<sup>54</sup> Women and Minorities, p. 12.

<sup>55</sup> Women and Minorities, p. 12.

## Career Patterns

Among academically employed doctoral scientists and engineers, fewer Hispanic women than others held the rank of full professor in 1989 (9 percent, compared with 18 percent of all women). The proportion of Hispanic women who were associate professors was about the same as for all women (22 percent versus 24 percent) (appendix B, table 20).

## Labor Market Indicators

Hispanic women scientists and engineers are slightly less likely than are all women to be in the labor force. In 1986, the Hispanic labor force participation rate was 92 percent, compared with an overall rate of 94 percent. In 1990, the rate for Hispanic female Ph.D.'s was 97 percent (appendix B, table 22).

Hispanic women reported an average annual salary substantially lower than that of all women scientists and engineers (\$25,200 versus \$29,900) in 1986. Furthermore, Hispanic women's salaries were equal to only 69 percent of Hispanic men's; in comparison, for all scientists and engineers, the salaries of women were equal to 75 percent of the salaries of their male colleagues.<sup>56</sup> Among doctoral scientists and engineers, Hispanic women reported median salaries slightly lower than those of all women in 1989 (\$42,700 and \$44,800, respectively) (appendix B, table 25). Hispanic women with Ph.D.'s in S&E had median annual salaries equal to 84 percent of their Hispanic male colleagues' salaries.

<sup>56</sup> Women and Minorities, p. 12.

## **chapter 2**

# *education and training of women in science and engineering*

---

### **OVERVIEW**

One major factor contributing to women's underrepresentation in the science and engineering (S&E) work force is that, at any educational level, women do not participate in science and mathematics training to the same extent as do men. Differences in participation—and interest—in mathematics and science appear first at the elementary and middle school levels. For example, the results of mathematics skill assessments (made at ages 9, 13 and 17) indicate that females' performance starts to lag behind that of males among 13-year-olds (middle school). On science assessments (also made at ages 9, 13 and 17), females score lower than males as early as age 9 (elementary school).

Although females take almost the same number of years of mathematics and science coursework, they are less likely to take advanced coursework in these subjects. These data, taken together with differences on mathematics and science skill assessments, indicate not only that potential leakages in the S&E education pipeline are greater for females than for males, but that the leakages for females occur very early in their precollege experience.

Lower participation in mathematics and science coursework and lower levels of performance on skill assessments in these subjects are partially reflected in the lower scores of females on examinations measuring mathematics and science achievement. For example, in 1991, females' scores on the mathematics component of the Scholastic Aptitude Test (SAT) were 44 points lower than males'. Lower proportions of females than males also scored in the highest range on this exam: in 1991, 6 percent of females and 14 percent of males scored above 650 (score range is 200 to 800).

The number of S&E bachelor's degrees awarded to women increased by 21 percent between 1979 and 1989; in comparison, the number awarded to men declined by 1 percent. The largest percentage increases for women have occurred in two fields: computer science and engineering.

Progress is also apparent at the graduate level. Enrollment of women in S&E graduate programs jumped 30 percent between 1982 and 1990, compared with a 12-percent increase for men. In addition, although women still tend to be concentrated in graduate programs in psychology and the social or life

sciences, their numbers have increased dramatically in engineering and computer science over the last several years.

Finally, women are also applying for—and receiving—Federal assistance for graduate study in greater numbers. Almost 2,700 women applied for National Science Foundation (NSF) Graduate Fellowship awards in science and engineering in 1990, accounting for almost 40 percent of the applicants. In 1975, women's share of applications was less than one-third.

### **PRECOLLEGE PREPARATION**

#### **Mathematics and Science Achievement**

This section examines cognitive differences in mathematics and science achievement exhibited by females and males at three precollege levels: elementary, middle, and secondary. The information in this section is based on results from mathematics and science assessments administered by the National Assessment of Educational Progress (NAEP), part of the Educational Testing Service. Since the late sixties, NAEP has conducted surveys of student proficiency in several content areas on national samples of students at the 9-, 13-, and 17-year-old age levels. The objective of these assessments is to determine how specific groups of U.S. students respond to exercises in different academic areas; the assessments are not intended to measure the performance of individual students. Achievement is assessed on a common scale of 0 to 500.

#### **Mathematics**<sup>1</sup>

Proficiency in mathematics is measured at five levels on a 500-point scale:

- Level 150 indicates proficiency with simple arithmetic facts.
- Level 200 shows beginning skills and understanding.
- Level 250 shows an understanding of basic operations and beginning problem-solving ability.
- Level 300 indicates proficiency in moderately complex procedures and reasoning.

---

<sup>1</sup> All information on mathematics assessment scores is based on table 27 in appendix B of this report.

- Level 350 shows mastery of both multistep problem solving and algebra.<sup>2</sup>

**Nine-Year-Olds.** Assessments are similar for 9-year old girls and boys. Between 1973 and 1990, overall mean scores on the mathematics assessment edged upward for both females and males; however, progress by males has been greater. In 1990, mean scores were 230.2 for females and 229.1 for males, up from 220.3 for females and 217.7 for males in 1973.

Levels of proficiency for females and males in this age group are remarkably similar. In 1990, virtually all students (99 percent) scored above level 150, indicating a mastery of simple arithmetic facts. Furthermore, 28 percent of both female and male 9-year-olds scored above level 250, showing a basic understanding of simple operations and problem-solving skills.

**Thirteen-Year-Olds.** The achievement test scores of females at this age level are also similar to those of males. In 1990, mean scores for females and males were 269.6 and 271.2, respectively. Although the 1990 scores are close, scores for males have shown a slightly greater increase since 1973. The 1990 scores represent an increase of 2.7 points for females, who had a mean score of 266.9 in 1973, and 6.1 points for males, whose mean score was 265.1.

In 1990, 16 percent of female and 19 percent of male 13-year-olds scored above level 300 (moderately complex procedures and reasoning). Scores have increased, however, for both females and males, especially at the basic problem-solving level (level 250). In 1978, 66 percent of female and 64 percent of male 13-year-olds scored above 250 on this assessment; by 1990, these percentages were 74 percent and 75 percent, respectively.

**Seventeen-Year-Olds.** The largest difference in mean scores occurs at this age level. The mean score of females in 1990 (302.9) was more than 3 points lower than that of males (306.3). Since 1973, changes in scores have not been significant for either group.

Lower percentages of females than males score above proficiency levels 300 (moderately complex procedures and reasoning) and 350 (mastery of both multistep problem solving and algebra). In 1990, 55 percent of females, compared with 58 percent of males, scored over 300, and 6 percent of females, compared with slightly less than 9 percent of males, scored above level 350.

## Science<sup>3</sup>

For science, the five proficiency levels are defined as follows:

- Level 150 shows knowledge of everyday science facts.
- Level 200 indicates an understanding of simple scientific principles.
- Level 250 shows an ability to apply basic scientific information.
- Level 300 indicates skill in analyzing scientific procedures and data.
- Level 350 shows an ability to integrate specialized scientific information.<sup>4</sup>

**Nine-Year-Olds.** Although females' performance has consistently been slightly lower than that of males, the gap narrowed between 1973 and 1990. In 1990, overall means for females and males were 227.1 and 230.3, respectively. Females scored, on average, 3.2 points lower than males. In 1973, females scored an average of 4.1 points lower than males. Mean scores for 1973 were 218.4 for females and 222.5 for males.

Small differences in proficiency are evident among male and female 9-year-olds. Whereas 29 percent of females scored over 250 (ability to apply basic scientific information), 33 percent of males did so. The proportions showing an ability to analyze scientific procedures and data (level 300) were 2 percent for females and 4 percent for males.

**Thirteen-Year-Olds.** In this age group also, females tend to score lower than males on the science assessment. In fact, 1990 scores show that the gap has widened since 1973. The overall mean score for females in 1990 (251.8) was almost 7 points lower than that for males (258.5). In 1973, the difference between scores for females (247.1) and males (251.7) was about 5 points.

Females also lag behind males in levels of scientific proficiency. About 53 percent of female 13-year-olds, but 60 percent of males, scored above level 250 (application of basic scientific information) on the most recent assessment. Likewise, the percentage who scored above level 300 (ability to analyze scientific procedures and data) was lower for females (9 percent) than for males (14 percent).

**Seventeen-year-olds.** The biggest difference in mean scores was found for this age group. In 1990, the overall mean of 285.4 for females was 10 points lower than that for males (295.6). These scores represent a decline from 1973 scores for both females, whose mean score in 1973 was 288.3, and males, whose mean score was 304.3.

<sup>2</sup> For a more detailed discussion of the mathematics assessment and levels of proficiency, see U.S. Department of Education, National Center for Educational Statistics (NCES), National Assessment of Educational Progress Program, Trends in Academic Progress Achievements of American Students in Science 1970-90, Mathematics 1973-90, Reading 1971-90, and Writing 1984-90, forthcoming, 1992. Report is prepared by ETS (Educational Testing Service).

<sup>3</sup> All information on science assessments is taken from table 28 in appendix B of this report.

<sup>4</sup> For a more detailed discussion of the science assessment, see U.S. Department of Education, NCES, National Assessment of Educational Progress Program, Trends in Academic Progress Achievements.

Females and males exhibit substantial differences in proficiency levels at this age. For example, the proportions scoring above 300 (ability to analyze scientific procedures and data) were 39 percent for females and 48 percent for males. The proportions scoring at or above level 350 (integration of specialized scientific information) were 6 percent (females) and 13 percent (males).

### Characteristics of College-Bound Seniors

Data on college-bound seniors collected by the Admissions Testing Program of the College Entrance Examination Board provide a comprehensive and robust source of material on this population. This section examines

- coursework in high school,
- scores on the SAT,
- scores on the SAT Achievement Test series,
- scores on advanced placement examinations, and
- undergraduate plans of college-bound seniors.

### Coursework

The most current data on number of years and type of science and mathematics courses taken in high school are for college-bound seniors. This population consists of individuals who take the SAT and complete its Student Descriptive Questionnaire.

In 1991, females reported completing an average of 3.7 years of mathematics coursework; the average for males was 3.8 years (appendix B, table 29). Although the number of years of study does not differ substantially between the sexes, females tend to take less advanced coursework in mathematics than do males. For example, over 90 percent of both females and males reported taking a geometry course, but a smaller percentage of females than males reported taking trigonometry (53 percent versus 58 percent) or calculus (17 percent versus 22 percent). Additionally, females were less often enrolled in honors mathematics courses than were males (22 percent compared to 24 percent).

In 1990, female college-bound seniors had studied natural science for an average of 3.2 years, compared with 3.3 years, for males. As is the case for math, coursework composition varies by sex. Almost all students, both female and male, had taken biology, but females were much less likely to have taken physics (37 percent, compared with 51 percent of males). The percentage who reported taking honors courses in physics was about the same for females (21 percent) than for males (22 percent).

There were fewer differences by sex for social science courses. Females and males had each taken about 3.4 years of coursework in these subjects. More females than males reported taking sociology (females, 17 percent; males, 12 percent) or psychology (females, 31 percent; males, 20 percent) classes. About the same proportion of females and

males—approximately half—had taken economics in high school. Slightly more females (23 percent) than males (21 percent) had taken honors courses in social science.

### Scholastic Aptitude Test Scores<sup>5</sup>

In 1991, females continued to score somewhat lower than males on the verbal component and substantially lower on the mathematics portion of the SAT (chart 2-1). Although there has been some fluctuation over the decade, differences in scores between females and males have narrowed on both the verbal and the mathematics sections since 1981. Scores for females have remained relatively constant and scores for males have decreased.

The mean verbal score for females in both 1981 and 1991 was 418; the mean verbal score for males fell from 430 in 1981 to 426 in 1991 (appendix B, table 30). The overall trend has been similar for both females and males: scores rose until the mid-eighties, then started to decline. Over the last 2-year period (1990 and 1991), scores for both females and males have continued to decline.

Chart 2-1. SAT scores, by sex: 1981-91

NOTE: The score range is 200 to 800 for each component.

SOURCE: Based on appendix B, table 30

<sup>5</sup> The Admissions Testing Program of the College Board offers the SAT to college-bound seniors. The examination consists of two components. The verbal component tests reading comprehension and vocabulary skills, and the mathematics component assesses the ability to solve problems by using arithmetic reasoning and basic algebra and geometry skills. The score range is 200 to 800 for each component.

The percentile rankings on the verbal component were similar for females and males in 1991. Roughly 3 percent of both females and males scored in the 650 to 800 range (appendix B, table 31). Rankings for both sexes were also similar at lower score ranges: 18 percent of females and 19 percent of males scored between 500 and 599, and 32 percent of both females and males scored between 400 and 499.

On the mathematics component, scores rose over the 10-year period by 10 points for females (from 443 to 453) and 5 points for males (from 492 to 497) (appendix B, table 30). The 10-year trend in scores differed between the sexes. For females, scores began to increase steadily in 1982, reaching a high of 455 in 1990. For males, scores increased to a high of 501 in 1986, followed by slight declines. In the last 2 years, scores for males have fallen.

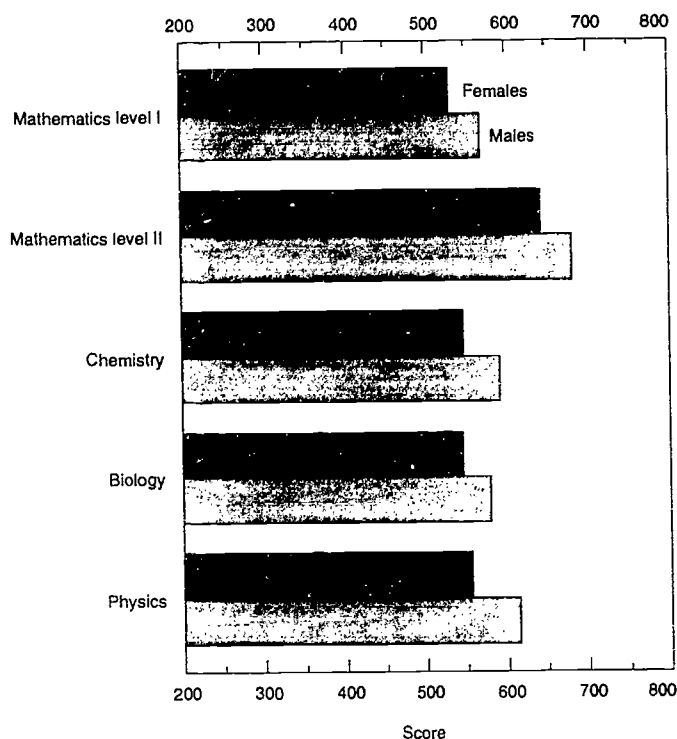

Females are much less likely than males to score in the 650 to 800 range on the mathematics component (appendix B, table 31). In 1991, only 6 percent of females, but about 14 percent of males, scored in this range. This difference has increased since 1981, when the proportions were 4 percent for females and 10 percent for males. However, the majority of both males (53 percent) and females (54 percent) scored in the 400 to 599 range in 1991.

### Achievement Test Scores <sup>6</sup>

Females are less likely than males to take achievement tests in science and mathematics.<sup>7</sup> In 1991, females accounted for 47 percent of test-takers who took one or more achievement exams in a science or mathematics field;<sup>8</sup> they also accounted for 52 percent of college-bound seniors who took the SAT.<sup>9</sup> Among students who took science and mathematics achievement tests, 24 percent of those who took the physics test were female, as were 54 percent of those who took the math I test and 53 percent of those who took the biology test.<sup>10</sup>

Scores on science and mathematics achievement tests were consistently lower for females than for males throughout the period from 1981 to 1991. In 1991, score differences ranged from 33 points on the biology test to 59 points on the physics exam (chart 2-2). These differences have remained fairly constant over the decade, with the exception of scores on the biology test, for which the difference in 1981 was 40 points.

Chart 2-2. Science and mathematics achievement test scores, by sex: 1991

NOTE: The score range is 200 to 800 for each test.

SOURCE: Based on appendix B, table 32

The SAT mathematics scores for those who took one or more science or mathematics achievement tests are also lower for females than for males. In 1991, the difference in scores between males and females for the mathematics level I test was 49 points (595 versus 546) (appendix B, table 32). The narrowest gap in SAT mathematics scores (33 points) was for those who took the physics exam (676 versus 643 points). Point differences in scores for other tests were 44, 45, and 51 points for mathematics level II, chemistry, and biology, respectively.

### Advanced Placement Examinations Scores <sup>11</sup>

In a pattern similar to that found among achievement test-takers, females account for a smaller share of advanced placement science and mathematics test-takers. Their proportion, however, has increased rapidly over the past 17 years. In 1990, females represented about 51 percent of all advanced

<sup>6</sup> In addition to the SAT, the Admissions Testing Program offers an achievement test series to college-bound seniors. The series includes 1-hour multiple choice exams in 14 academic areas. About one in five of those students who take the SAT also take one or more of the achievement tests. The score range is 200 to 800 for each component.

<sup>7</sup> Of the 14 academic subjects in which achievement tests were administered in 1991, 5 were in science and mathematics fields: mathematics level I, mathematics level II, biology, chemistry, and physics.

<sup>8</sup> College Bound Seniors, 1991 Profile of SAT and Achievement Test Takers, National Report (Princeton, NJ: Educational Testing Service, 1991), p. 11, and unpublished tabulations for females. This percentage was obtained by combining data for five science and math fields.

<sup>9</sup> College Bound Seniors, National Report, p. 6.

<sup>10</sup> College Bound Seniors, National Report, p. 6.

<sup>11</sup> The College Board also administers the Advanced Placement Program. In this program, a series of exams are offered in 29 areas, 9 of which are in science and mathematics/computer science. A student who does well on one or more of these exams may be granted college credit or appropriate placement by participating higher education institutions. The advanced placement grading scale ranges from 1 (no recommendation for credit) to 5 (extremely well qualified in the subject area). About 15 percent of college-bound seniors participate in this program.

placement test-takers,<sup>12</sup> up from 41 percent in 1973 and 48 percent in 1988.<sup>13</sup> However, females tended to take fewer advanced placement science and mathematics/computer science exams. In 1990, females took 49 percent of approximately 481,000 advanced placement exams taken by students. Representation of females differs by advanced placement test topics. Among science fields, roughly 52 percent of the biology tests, 34 percent of the chemistry tests, and 17 percent of the physics C-electricity/magnetism tests were taken by females<sup>14</sup> (chart 2-3). Among candidates in the mathematics/computer science fields, female representation ranged from

about 43 percent of mathematics/calculus AB<sup>15</sup> test-takers to 16 percent of the computer science AB<sup>16</sup> test-takers.

Females continued to score lower than males on the science and mathematics/computer sciences advanced placement examinations in 1990 (table 2-1). Scores for females were generally in the 2-point (possibly qualified) to 3-point (qualified) range for each of the exams, scores for males were around the 3-point mark (qualified) or higher. Females scored in the fully qualified range only on the mathematics/calculus BC and AB exams (average scores of 3.48 and 3.07, respectively) and on the physics C-electricity and magnetism exams (average score of 3.01). The trends in scores on these tests have been the same for females and males for the last several years.

**Chart 2-3. Proportions of students who took science and mathematics advanced placement tests who were female: 1990**

SOURCE: 1990 Advanced Placement Program, National Summary Reports (Princeton, NJ: Educational Testing Service, 1990)

**Table 2-1. Advanced placement examination scores for female and male test-takers: 1990**

Exam	Females	Males
Biology	2.80	3.13
Chemistry	2.65	3.09
Physics B	2.37	2.96
Physics C-mechanics	2.90	3.47
Physics C-electricity and magnetism	3.01	3.38
Mathematics/calculus AB	3.07	3.35
Mathematics/calculus BC	3.48	3.74
Computer science AB	2.35	2.90
Computer science A	2.37	3.03

SOURCE: Appendix B, table 33

### *Intended Undergraduate Major*<sup>17</sup>

Females are slightly more likely than males to choose a science major, but males are much more likely than females to choose engineering. In 1991, roughly 25 percent of females—compared with 22 percent of males—intended to major in a science field (appendix B; table 34). Both of these proportions have been declining since 1983, however, when about 27 percent of females and 30 percent of males planned science majors. The decline is the result of a sharp decrease in interest in computer science programs. When interest in computer science peaked, in 1983, about 9 percent of females and 12

<sup>12</sup> 1990 Advanced Placement Program, National Summary Reports, Advanced Placement Program of the College Entrance Examination Board (Princeton, NJ: Educational Testing Service, 1990).

<sup>13</sup> Advanced Placement Program, The College Board, AP Yearbook 1988 (New York: The College Entrance Examination Board, 1988), p. 5.

<sup>14</sup> The physics C-electricity/magnetism advanced placement exam and the physics C-mechanics exam allow a student the opportunity to earn placement or credit in only one of these areas of physics. In contrast, the physics B exam covers all aspects of physics, and a student who scores well on this exam may earn as much as a semester's course credit in this field.

<sup>15</sup> Two advanced placement exams are offered in mathematics/calculus. The calculus AB exam is not as rigorous as the calculus BC exam. Although up to a full year of college credit may be earned by those who score well on the BC test, scores on the AB test are used primarily for appropriately placing students in courses.

<sup>16</sup> In 1988, the examination for computer science placement was divided into two separate tests. The computer science A exam concentrates on programming methodology and procedural abstraction. The computer science AB exam includes all questions on the A test but contains more in-depth material on algorithms, data structures, and data abstraction.

<sup>17</sup> The intended undergraduate major of college-bound seniors is determined by answers to questions on the Student Descriptive Questionnaire distributed to all college-bound seniors as part of the SAT application package. The questions ask students to choose their first choice of college curriculum from a list of 29 major categories, of which 6 are in science and 1 is in engineering.

percent of males chose computer science as their undergraduate field. By 1991, these percentages had fallen to 2 percent and 4 percent, respectively. Within science fields, there were substantial differences between females and males (chart 2-4). The majority of females (55 percent) intended to major in the social sciences, whereas only 23 percent of the males intended to do so.

**Chart 2-4. Intended undergraduate S&E major, by sex: 1991**

<sup>1</sup> Includes physical sciences, mathematics, biology, and agriculture.

SOURCE: 1991 Profiles of SAT and Achievement Test Takers (Princeton, NJ: Educational Testing Service, 1991)

Also in 1991, only 4 percent of females, but 18 percent of males, intended to major in engineering (based on appendix B; table 34). During the eighties, the propensity to choose engineering declined for males, but remained relatively constant for females.

SAT mathematics scores for college-bound seniors who plan to major in a science or engineering field are generally lower for females than for males. These scores varied widely by major, however. For example, the 1991 score range for females was 406 (computer science) to 585 (mathematics); for males, the range was 441 (agriculture) to 623 (mathematics) (appendix B, table 34). Nationally, math scores were 453 and 497 for females and males, respectively (appendix B; table 30).

## UNERGRADUATE EDUCATION

### Characteristics of American Freshmen

Data on freshmen are collected annually by the Cooperative Institutional Research Program at the University of California, Los Angeles.<sup>18</sup> The survey reflects responses from a national sample of American freshmen at 4-year colleges and universities.<sup>19</sup>

### Grade Point Average

Most recent grade point average (GPA) data indicate that students who intend to major in science and engineering fields are more academically prepared than students in other programs; this statement is true regardless of sex. For example, almost 40 percent of both females (39 percent) and males (38 percent) who indicated they would probably major in S&E fields reported a high school GPA in the A range in 1990 (appendix B, table 35). Overall, these proportions were 27 percent for females and 21 percent for males.

The percentage of female freshmen with A averages who intend to major in S&E fields has not changed over the decade; 41 percent had A averages in 1980. In comparison, 35 percent of freshmen males who were potential S&E majors reported a high school GPA in the A range. Overall, the proportions of females and males with A averages were 27 percent and 19 percent, respectively.

### Degree Aspirations

Among 1990 freshmen planning to major in science and engineering, the highest proportion of both females and males (35 percent and 39 percent, respectively) indicated a master's degree as their highest planned degree (appendix B, table 35). Of other degrees, females planned to study for a doctorate, medical, or law degree to a greater extent than did males. For example, 27 percent of females, compared with 22 percent of males, planned to obtain a Ph.D.

Degree aspirations have not changed for female freshmen over the decade. In 1980, 35 percent of female freshmen planning to major in S&E fields stated that a master's was the highest degree they planned to obtain. A slightly smaller percentage (36 percent) of males in 1980 than in 1990 had similar educational aspirations.

### Level of Parents' Education

Both female and male prospective science and engineering majors report similar educational credentials for their parents.

<sup>18</sup> The Graduate School of Education at UCLA and the American Council of Education jointly sponsor the Cooperative Institutional Research Program. The program was introduced in 1966 as a continuing longitudinal study of the American higher education system. One of the cornerstones of the program is the American Freshmen Norm Survey.

<sup>19</sup> The American Freshman Norm Survey, Cooperative Institutional Research Program, Graduate School of Education, University of California, Los Angeles. Although freshmen at 2-year colleges are surveyed, only responses for those at 4-year colleges and universities are reported here.

In 1990, 49 percent of females and 53 percent of males indicated that their fathers had either a baccalaureate or a graduate degree (appendix B, table 35). The mothers of 39 percent of the females and 42 percent of the males had a baccalaureate or a graduate degree.

### Annual Parental Income

Estimated parental income is also very similar for both females and males who intend to major in an S&E field. For example, in 1990, 45 percent of females and 48 percent of males reported that their parents' annual income was above \$50,000 (appendix B, table 35). At the lower income brackets, 16 percent of females and 11 percent of males placed their parents' income at less than \$20,000 per year.

### Plans for Financial Aid

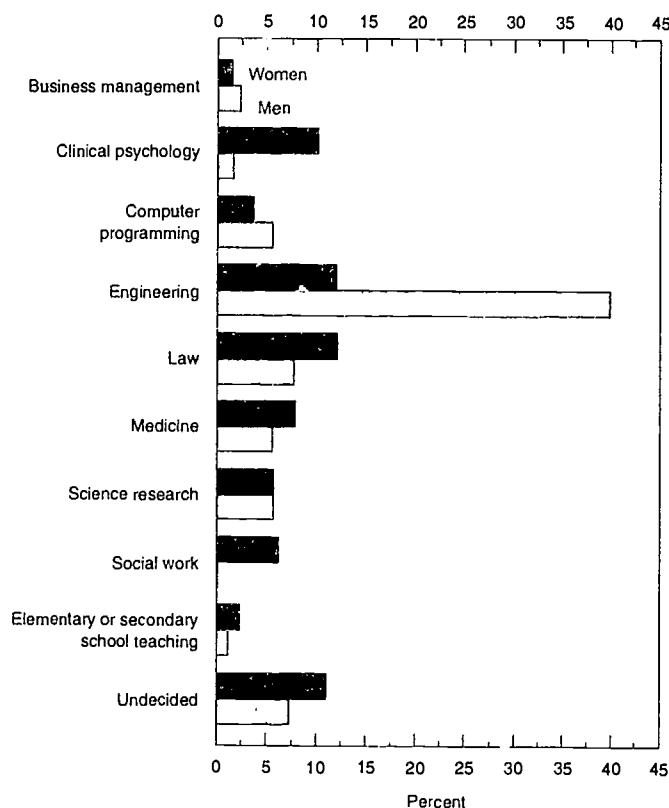

A large proportion of both female (54 percent) and male (48 percent) 1989 freshmen expressed "some" concern about financing their education.<sup>20</sup> Furthermore, 16 percent of the females and 11 percent of the males expressed "major" concern. Similarly, among 1989 freshmen planning S&E majors, the proportion stating that they had "some" or "major" concern about financing their education was higher among females (54 percent and 16 percent) than among males (51 percent and 11 percent).

Two types of financial support were listed by a majority of both male and female S&E students: relatives and savings. In 1989, approximately 86 percent of the women and 82 percent of the men said that relatives were a major source of financial support; 60 percent of the females and 58 percent of the males said they used savings from summer work. Another source that was cited by over a quarter of the students of each sex (females, 30 percent; males, 27 percent) was grants or scholarships other than Pell grants, Supplementary Educational Opportunity Grants, or State or local college work study grants.

### Intended Career

Whereas socioeconomic characteristics of female and male freshmen who are prospective science and engineering students do not differ substantially, the intended career choices of these students do (chart 2-5). In 1990, the differences were particularly noticeable among students planning careers in clinical psychology, social work, and engineering. About 10 percent of females, but less than 2 percent of males, planned a career in clinical psychology or social work. In contrast, 12 percent of females and 40 percent of males planned careers in engineering. Among other fields, females more often chose

Chart 2-5. Intended career choices of female and male freshmen majoring in S&E fields, by selected occupation: 1990

SOURCE: Based on appendix B, table 36

law (12 percent versus 8 percent), whereas males more often chose computer programming (6 percent versus 4 percent). Very few of either sex (females, 2 percent; males, 1 percent) planned an elementary or secondary school teaching career.

### Graduate Record Examination<sup>21</sup>

The Educational Testing Service offers a series of tests—the Graduate Record Examination (GRE)<sup>22</sup>—to potential graduate students who plan further study in the arts and sciences. GRE scores, which are used primarily by graduate and professional schools to supplement undergraduate records, may also be used to examine undergraduate S&E preparation.

Although more women (111,900) than men (97,600) took the GRE in 1987,<sup>23</sup> women test-takers were much less likely than men to have majored in a science or engineering field at the

<sup>21</sup> GRE data more recent than 1987 were unavailable in the format needed to update this report; therefore, this section is extracted from the 1990 report.

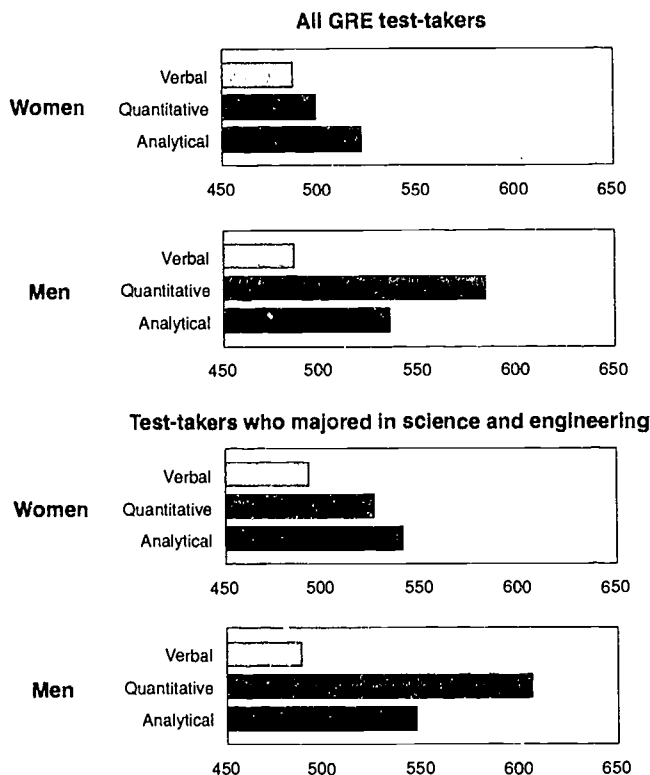

<sup>22</sup> The GRE consists of a general aptitude test and advanced tests in 20 subject areas. The aptitude test comprises three components. The verbal component assesses the ability to use words in solving problems; the quantitative portion tests the ability to apply elementary mathematical skills and concepts to solve quantitative problems; and the analytical component, a relatively new addition to the test (1979), measures deductive and inductive reasoning skills. The score range on the GRE is 200 to 800.

<sup>23</sup> Graduate Record Examination Board. A Summary of Data Collected from Graduate Record Examination Test-Takers During 1986-87. Data Summary Report no. 12 (Princeton, NJ: Educational Testing Service, 1988), p. 68.

<sup>20</sup> Alexander Astin, William S. Korn, and Ellyne R. Berz, *The American Freshman: National Norms for Fall 1989*. Cooperative Institutional Research Program, University of California, Los Angeles, December 1990, pp. 23 and 39. Information for 1989 is presented because this question was not asked in the 1990 survey. Information for freshmen majoring in S&E fields is from unpublished tabulations.

undergraduate level (49 percent versus 72 percent).<sup>24</sup> The average scores of those test-takers who majored in S&E fields were higher than the average scores of all test-takers on every component of the exam (chart 2-6).

**Chart 2-6. GRE scores, by sex—all test-takers and test-takers who majored in science and engineering: 1987**

NOTE: The score range is 200 to 800 for each component.  
SOURCE: Appendix B, table 37, and unpublished data

In 1987, among those who majored in S&E fields, women generally scored slightly higher than men on the verbal component, much lower on the quantitative, and slightly lower on the analytical. These differences generally persisted across fields, but with wide variations (table 2-2). For example, women who majored in engineering scored higher than men on the verbal and analytical sections by roughly 30 points and 40 points, respectively, but scored lower (12 points) on the quantitative component.

Between 1979 (the earliest year for which comparable data are available) and 1987, scores for both men and women who majored in S&E fields remained essentially the same on the verbal component but rose on the other two components (appendix B, table 37). Some of the most dramatic increases

**Table 2-2. GRE scores for female and male test-takers, by undergraduate major: 1987**

Component and field	Females	Males
<b>Verbal</b>		
Physical science	509	504
Mathematical science	474	488
Biological science	506	502
Behavioral science	504	513
Social science	456	461
Engineering	492	461
<b>Quantitative</b>		
Physical science	615	648
Mathematical Science	635	670
Biological science	558	585
Behavioral science	494	539
Social science	454	511
Engineering	663	675
<b>Analytical</b>		
Physical science	580	568
Mathematical science	585	590
Biological science	563	551
Behavioral science	530	530
Social science	493	495
Engineering	601	557

NOTE: The score range is 200 to 800 for each component.  
SOURCE: Appendix B, table 37

occurred for women majoring in biological science or engineering. On the quantitative component, scores for these women rose from 528 to 558 (biological science) and from 603 to 663 (engineering). The corresponding increases in analytical scores were from 526 to 563 and from 534 to 601. Scores for men in these fields also rose, but to a lesser extent.

### Bachelor's Degree Production<sup>25</sup>

Almost 308,000 science and engineering bachelor's degrees were granted by U.S. institutions in 1989; almost 124,000 (40 percent) of these were earned by women. A decade earlier, women earned almost 102,300—35 percent—of these degrees (appendix B; tables 38 and 40). By field, women were more highly represented in the sciences than in engineering (table 2-3), although with considerable variation among fields.

Women are more likely than men to earn degrees in life and social sciences and in psychology; men are more heavily concentrated in engineering fields. In 1989, approximately two-thirds of women who received S&E bachelor's degrees earned degrees in the social sciences (27 percent), psychology (28 percent), or agricultural and biological sciences (19 percent). In contrast, only 8 percent received degrees in engineering, and most were in electrical engineering (3 percent) (based on Appendix b; table 40). Almost one-third of men earned degrees in engineering, with the largest shares in

<sup>25</sup> Data for bachelor's degrees in science and engineering are from the U.S. Department of Education, National Center for Education Statistics' annual Survey of Earned Degrees; these have been grouped into science and engineering categories used by NSF. Therefore, these data may differ from those in reports published by the U.S. Department of Education.

<sup>24</sup> For the purposes of this analysis, S&E fields include physical sciences, mathematical sciences, engineering, biological sciences, behavioral sciences, and social sciences.

**Table 2-3. S&E bachelor's degrees granted to women, by field: 1989**

Field	Number of women	Percentage of total
Total	123,793	40.2
Sciences, total	113,549	47.2

electrical (12 percent), mechanical (7 percent), and civil specialties (4 percent). Among science fields, the largest proportions of men earned degrees in social sciences (23 percent) or computer sciences (12 percent).

Between 1979 and 1989, these patterns of S&E degree production changed markedly. Overall, the number of S&E baccalaureates earned by women in 1989 was 21 percent higher than the number earned in 1979; men earned 1 percent fewer degrees in 1989 than in 1979.

## GRADUATE EDUCATION

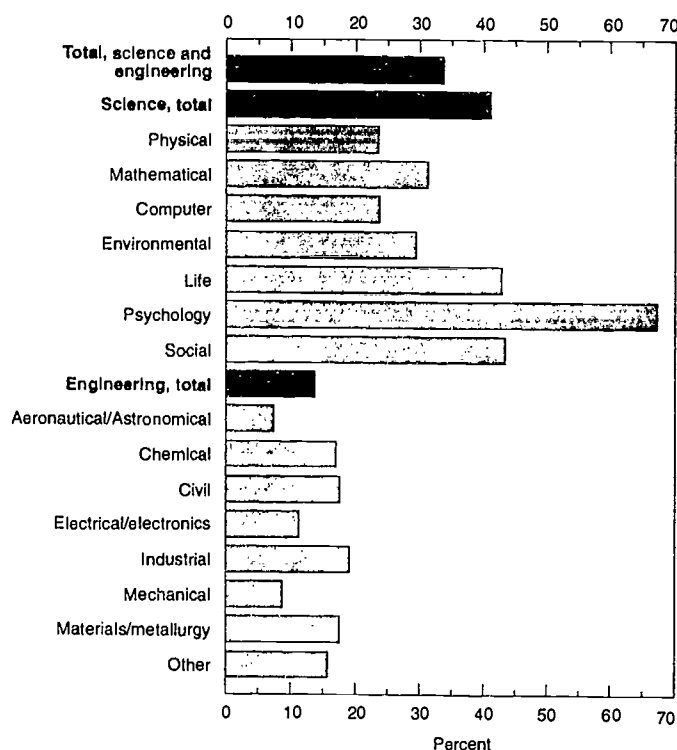

Graduate education represents another critical point in the science and engineering pipeline. Because an advanced degree is considered an entry-level requirement in many S&E fields, students who terminate their formal education at the undergraduate level may be precluded from working in their field of study. This section concentrates on several aspects of graduate education, including the following:

- Graduate enrollment in S&E programs.
- Graduate degree attainment rates in S&E fields.
- Advanced degree production in S&E fields.
- Sources of support for those pursuing S&E doctorates.
- Characteristics of NSF fellowship recipients.

## Graduate Enrollment<sup>26</sup>

In 1990, women constituted about one-third (135,277 of 401,569 students) of the graduate enrollment in science and engineering programs; this proportion in 1982<sup>27</sup> was 31 percent (104,105 of 340,707 students; appendix B, tables 42 and 44). Representation of women varies considerably by field (chart 2-7). For example, within science fields, women accounted for about two-thirds of enrollment in psychology programs; within engineering, the largest fraction (19 percent) of women was in industrial engineering.

**Chart 2-7. Women as a percentage of graduate enrollment, by S&E field: 1990**

SOURCE: Based on appendix B, tables 42 and 44

Most women who were enrolled in graduate programs in 1990 were in one of three fields: social sciences, psychology, or life sciences. Only about 11 percent were enrolled in engineering fields, most often electrical (3 percent) and civil and industrial (2 percent) engineering. Men, in contrast, were most highly concentrated (35 percent) in engineering graduate programs, primarily in the electrical (11 percent), mechanical (6 percent),

<sup>26</sup> Data presented in this section are from the NSF's Survey of Graduate Science and Engineering Students and Postdoctorates. This survey has been conducted annually since 1966. The most recent survey was completed in 1990.

<sup>27</sup> The earliest year for which comparable data are available.

and civil (5 percent) subfields (based on appendix B, tables 43 and 44).

The majority of both women (65 percent) and men (68 percent) were enrolled full-time in graduate S&E programs (based on appendix B, table 45). In science fields, 66 percent of the women were enrolled full-time and 71 percent of the men; in engineering similar percentages of women (59 percent) and men (61 percent) were enrolled full-time.

Since 1982, there have been substantial changes in these distributions, resulting from very different growth rates over the 8-year period. Overall, graduate enrollment of women in S&E fields increased by 30 percent between 1982 and 1990; this increase was significantly higher than the 12-percent growth rate experienced by men. For women, the fields with the greatest increase between 1982 and 1990 in the number enrolled were engineering (67 percent), and computer and physical sciences (50 percent). The greatest increases for men were in computer science (83 percent) and engineering (25 percent). Growth rates were much lower for women in earth, atmospheric, and oceanographic sciences, and the social and life sciences; the number of men enrolled in graduate programs in these fields increased only slightly or declined.

### Graduate Degree Attainment Rates

An indicator of the progress made by women in earning advanced S&E degrees is the graduate degree attainment rate—that is, a group's propensity to complete graduate degrees. At the master's degree level, this rate is defined as the number of S&E master's degrees expressed as a percentage of the number of S&E bachelor's degrees awarded 2 years earlier. At the doctorate level, attainment is measured by the actual median elapsed time between baccalaureate and S&E doctorate, as reported by new doctorate recipients.<sup>28</sup>

### Master's Degree Attainment<sup>29</sup>

In 1989, the master's degree attainment rates were 17 percent for women and 24 percent for men. This difference in attainment rates masks two very different trends in degree production for women and men. First, the rate for men has increased because baccalaureate production has fallen off and master's degree production has risen very gradually. On the other hand, the rate for women has increased only marginally because degree production at both levels has risen, and production of master's degrees has outpaced that of baccalaureates.

### Doctorate Attainment

At the doctorate level, median elapsed time between degrees is higher for women than men (9.1 years versus 8.4 years in 1990) (appendix B, table 47). However, the number of years between bachelor's and doctoral degree attainment has

increased over the decade from 1980 to 1990 for all S&E doctorates—from 7.6 years to 8.6 years. This overall increase in the time it takes to earn an S&E doctorate is attributable to the increased time (1.1 years) reported to earn a degree in the sciences; elapsed time to an engineering Ph.D. has not increased as much (0.4 year) over the decade.

In 1990, the longest elapsed time (11.4 years) between baccalaureate award and completion of a Ph.D. for women was in computer science; it increased by more than 3 years from 1980 to 1990. The greatest increase for men was 2.4 years, for a doctorate in psychology; in 1990 the elapsed time was 10.1 years. For other science fields in 1990, the longest elapsed time between degrees was in the social sciences (12.1 years for women and 10.5 years for men), and the shortest was in the physical sciences (women, 6.9 years; men, 7.1 years). In engineering, median elapsed time to degree was lower for women (7.8 years) than for men (8.2 years).

### Advanced Degree Production

#### Master's Degrees<sup>30</sup>

In 1989, women received 31 percent (20,746) of the master's degrees conferred in science and engineering (66,026), up from 26 percent (14,040 of 54,456 degrees) a decade earlier. Men received 45,262 master's degrees in 1989; this was a 12-percent increase over the number they received in 1979 (40,416) (appendix B, tables 48-50). By field, women accounted for 42 percent of science degrees and 13 percent of engineering degrees (table 2-4).

Table 2-4. Advanced degrees granted to women in science and engineering, by field: 1989

Field	Master's degrees		Doctorates	
	Number of women	Percentage of total	Number of women	Percentage of total

SOURCE: Appendix B, tables 48, 50, 52 and 54

<sup>28</sup> Data on median elapsed time between baccalaureate and doctorate are from the NSF's Survey of Earned Doctorates.

<sup>29</sup> Attainment rates were calculated with data from tables 38-40 and 48-50 in appendix B of this report.

<sup>30</sup> Data for master's degrees in science and engineering are from the U.S. Department of Education, National Center for Education Statistics' annual Survey of Earned Degrees; these have been grouped into science and engineering categories used by NSF. Therefore, these data may differ from those in reports published by the U.S. Department of Education.

The field distribution of women who earn master's degrees parallels that at the bachelor's degree level. Women were most likely to earn their degrees in psychology (28 percent), agricultural and biological sciences (17 percent), or the social sciences (13 percent) (based on appendix B, table 50). About 15 percent of the women were granted engineering degrees; these were concentrated in the electrical, civil, and industrial subfields. In contrast, almost 46 percent of the men earned engineering degrees; another 26 percent were granted degrees in either the life sciences or computer science (based on appendix B, table 49).

The growth in the number of S&E master's degrees earned by females between 1979 and 1989 far exceeded the growth for men (48 percent versus 12 percent). The greatest percentage increases for women were in computer science, astronomy, and engineering. The number of men earning degrees in science fields declined from 1979 to 1989 in all fields except earth, atmospheric, and oceanographic sciences, mathematics, and computer science. In the 6-year period from 1983 to 1989, the number of S&E master's degrees for women increased at an average annual rate of 3 percent; for men the growth rate was 1 percent.

### **Doctorates**<sup>31</sup>

Trends in degree production at the doctoral level do not differ substantially from those at either the bachelor's or master's degree levels. The representation of women earning doctorates in science and engineering fields has increased dramatically, rising from 21 percent (3,688 of 17,624 degrees) in 1979 to 28 percent (6,008 of 21,541 degrees) in 1989 (appendix B, tables 52 and 54).<sup>32</sup> By field, women accounted for a larger proportion of the Ph.D.'s in science (34 percent) than in engineering (8 percent) in 1989 (table 2-4).

About 60 percent of women earned their doctorates in psychology (30 percent) or the agricultural and biological sciences (29 percent) in 1989 (based on appendix B, table 54). Only 6 percent earned engineering doctorates, most often in chemical and electrical specialties. The field distribution of men earning doctorates differs from this pattern: two-thirds earned doctorates in the agricultural and biological sciences (22 percent), physical science (17 percent), or engineering (27 percent; based on appendix B; tables 53).

The number of S&E doctorates granted to women increased by 63 percent between 1979 and 1989; the number awarded to men rose by only 12 percent. For women, above-average growth rates were experienced in engineering (up 502 percent, to 375 degrees) and computer science (up 296 percent, to 107 degrees). For men, computer science showed the most significant growth (176 percent) over the decade.

<sup>31</sup> Data on science and engineering doctorates granted in the United States are from the Survey of Earned Doctorates, conducted annually for NSF by the National Academy of Sciences.

<sup>32</sup> These figures will differ from those presented by citizenship status. The classification used for bachelor's and master's degrees does not include as many subfields in the general field categories, which results in fewer degrees being reported.

A different picture of S&E doctorate production emerges when the data are classified by citizenship. The slower overall growth among male doctorate recipients between 1980 and 1990 is largely the result of a decline in the number of male U.S. citizens earning these degrees (down by 11 percent from 1980 to 1990; based on appendix B; tables 55 and 56). In 1990, about one of every two male doctorate recipients was a U.S. citizen, down from three of four a decade earlier. The trend for women has been very different: the number of women earning S&E doctorates increased regardless of citizenship, although the number of women on temporary visas showed the most rapid growth. As a result of the growth in this group, the fraction of degrees awarded to women who were U.S. citizens had fallen to 74 percent in 1990, down from 86 percent in 1980.

### **Graduate Support Status**

Of U.S. citizens who received a doctorate in a science or engineering field in 1990 and reported a primary source of support, both women and men reported universities more often than any other source (chart 2-8). A smaller proportion of women than of men reported this source, however (47 percent versus 58 percent). Among nonacademic sources of funding, women (40 percent) were more likely than men (28 percent) to rely on personal or family resources. Federal support was reported as the primary source of support by 10 percent of the women and 9 percent of the men.

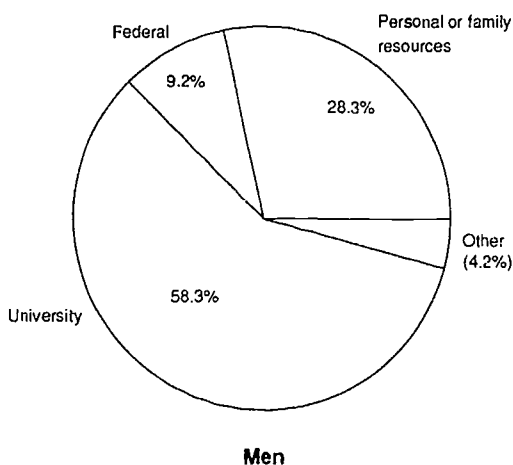

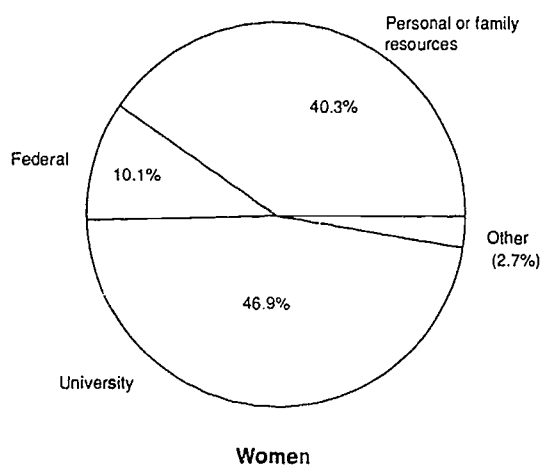

### **National Science Foundation Fellowships**<sup>33</sup>

Between 1975 and 1990, the representation of women in NSF's Graduate Fellowship Program rose substantially. In fiscal year (FY) 1990, women accounted for 42 percent (2,680) of all fellowship applicants, up from 31 percent (1,778) in FY 1975 and 37 percent (1,614) in FY 1985. In terms of the number of new awards offered, women's representation also increased—42 percent (357) in FY 1990, up from 27 percent (146) in FY 1975 and 33 percent (178) in FY 1985 (appendix B; tables 64-66).

Fellowship applications and award representation vary considerably by field. In FY 1990, women accounted for 33 percent of the applicants and 36 percent of the new awards granted in all engineering, mathematics, and physical science fields combined. However, they represented 52 percent of applicants and 49 percent of new award recipients in the behavioral and social science fields. In the life and medical sciences, the proportion of women who received new awards (53 percent) was similar to their share of applicants (54 percent).

<sup>33</sup> Data on this topic are from the NSF's Fellowship Program, collected by the National Academy of Sciences in support of NSF programs.

**Chart 2-8. Major sources of support for 1990  
U.S. Citizen S/E doctorate recipients, by sex**

NOTE: Calculations include only those who reported a major source of support.  
SOURCE: Based on appendix B, table 63

## POSTDOCTORAL APPOINTMENTS<sup>34</sup>

The number of women holding S&E postdoctoral appointments has risen along with the growth in the number of women earning science and engineering Ph.D.'s. Although doctorate production rose by 63 percent in the last 10 years, the number of women holding postdoctorates increased by 92 percent between 1979 and 1989.<sup>35</sup> In 1989 about 4,200 postdoctoral appointments in science and engineering were held by women; this number represented 29 percent of all such appointments (appendix B, table 70). In comparison, women accounted for 21 percent of S&E postdoctoral appointments in 1979.

<sup>34</sup> Data in this section are from the NSF's Survey of Doctorate Recipients, conducted biennially for NSF by the National Academy of Sciences.

<sup>35</sup> Figures for 1979 are from National Science Foundation, Characteristics of Doctoral Scientists and Engineers in the United States: 1979, NSF 80-323, Surveys of Science Resources series, detailed statistical tables, 1980, p. 18.

## chapter 3

# minorities in science and engineering

---

### OVERVIEW

In relation to their representation in the overall U.S. work force in 1988, both blacks and Hispanics remained underrepresented in science and engineering. Asians are not underrepresented, and the proportion of Native Americans among scientists and engineers is roughly equal to their representation in the total U.S. labor force.

The 139,200 black scientists and engineers employed in 1988 constituted 2.6 percent of all scientists and engineers, up from 1.8 percent in 1978. However, blacks accounted for 10 percent of total U.S. employment in 1988, and almost 7 percent of all employed professional specialty workers. Asians represented about 5 percent (268,100) of all scientists and engineers, but only about 2 percent of the U.S. labor force. There were about 21,900 Native American scientists and engineers in 1988, accounting for less than 1 percent of total science and engineering (S&E) employment; this proportion was roughly similar to their representation in the overall U.S. work force. In 1988, about 1.8 percent (95,900) of all employed scientists and engineers were Hispanic; the Hispanic shares of all employed persons and those in professional specialty occupations were 7 percent and 3 percent, respectively. Hispanic representation in the work force remained at these levels in 1990.

Over the decade from 1978 to 1988, employment of black scientists and engineers increased about twice as rapidly as did employment of whites—192 percent (11 percent per year) versus 97 percent (7 percent per year). Employment of Asians rose by 146 percent (9 percent per year).

Racial/ethnic groups differ with respect to field distributions. The proportions in engineering ranged from about 56 percent of Asians to 32 percent of blacks; in contrast, about 52 percent of whites were engineers. In the sciences, blacks are more likely than others to be social scientists and psychologists, and Asians are least likely to be in those fields.

Asians—and, to a lesser extent, Hispanics—are less likely than other scientists and engineers to report management or administration as their primary work activity. For example, 22 percent of Asians and 28 percent of Hispanics cited management as their major activity in 1986. Blacks (31 percent) and Native Americans (30 percent) were just as likely as whites

(30 percent) to hold management positions.

On average, black and Hispanic scientists and engineers earn salaries below those earned either by whites or by all scientists and engineers combined. In contrast, Asians and Native Americans report salaries equal to or greater than those for whites. Salaries for blacks averaged 81 percent of those for whites in 1986. Hispanics earned amounts equal to 90 percent of the average salaries paid across all racial/ethnic groups.

Whites tended to earn more than members of minority groups, regardless of educational level, with one exception. Asians who received bachelor's degrees in 1988 or 1989 earned salaries that were 15 percent higher than those of whites who received degrees in S&E fields; at the doctorate level, Asians with one year or less of professional experience earned 6 percent more than whites with a similar experience. In 1990 blacks who had received bachelor's degrees in 1988 or 1989 earned salaries equal to 92 percent of the salaries of their white colleagues; blacks who received master's degrees earned salaries that were 93 percent. At the doctorate level, the salaries of black Ph.D.'s with one year or less of professional experience were equal to 95 percent of the salaries earned by white Ph.D.'s with comparable experience.

Minorities generally are more likely than majority scientists and engineers to be unemployed and underemployed. For example, unemployment among black scientists and engineers in 1986 averaged 3.8 percent; for whites and Asians, the unemployment rates were 1.5 percent and 1.8 percent, respectively. Almost 6 percent of blacks reported that they were underemployed in 1986, as did 2.5 percent of whites and 2.2 percent of Asians.

This pattern was also true in 1990 for recent college graduates with bachelor's and master's degrees. Blacks with bachelor's degrees had an unemployment rate of 6.4 percent, and those with master's degrees, 4.6 percent. Comparable unemployment rates for whites were 3.0 percent and 1.6 percent; rates for Asians were 5.6 percent and 3.3 percent. Furthermore, the unemployment rate of black Ph.D.'s (3.7 percent) was more than four times the rate for whites (0.8 percent) and Asians (0.7 percent). Employed black Ph.D.'s were also more likely to be underemployed (2.9 percent) than were whites (1.3 percent) and Asians (0.9 percent).

## BLACKS IN SCIENCE AND ENGINEERING

### Employment Levels and Trends

Blacks remain underrepresented in science and engineering despite significant employment gains over the past decade. Over the decade from 1978 to 1988, employment of black scientists and engineers increased roughly twice as fast as employment of their white counterparts—192 percent (11 percent per year) versus 97 percent (7 percent per year) (based on appendix B, table 1).

In 1988, the 139,200 employed black scientists and engineers represented 2.6 percent of all employed scientists and engineers, up from 1.8 percent (47,700) in 1978 (chart 3-1). Blacks in 1988 represented about 10 percent of total U.S. employment and 6.7 percent of those employed in professional specialty occupations.<sup>1</sup> In 1990 blacks continued to account for 10

Chart 3-1. Minorities as a percentage of employed scientists and engineers: 1988

<sup>1</sup> About one-quarter of Asian scientists and engineers were not U.S. citizens.

<sup>2</sup> Includes members of all racial groups

SOURCE: Based on appendix B, table 1

<sup>1</sup> U.S. Department of Labor, Bureau of Labor Statistics, Employment and Earnings, vol. 34, no. 1 (Washington, DC: U.S. Government Printing Office, January 1987), p. 179.

percent of the total U.S. employment and 6.7 percent of those in employed in professional specialty occupations.<sup>2</sup>

Blacks also remain underrepresented in the doctoral S&E work force. Over the decade from 1979 to 1989, employment of black Ph.D.'s increased by 122 percent (8 percent per year), while white employment rose by 39 percent (slightly over 3 percent per year). In 1989, about 1.6 percent (7,190) of the doctoral S&E work force was black, up from about 1 percent (3,235) in 1979 (appendix B, table 3).

Among scientists and engineers at all degree levels in 1988, twice as many blacks as whites were non-U.S. citizens (3 percent versus 1.5 percent). At the doctoral level in 1989, approximately 14 percent of blacks and 3 percent of whites were non-U.S. citizens.<sup>3</sup>

### Field

By field, the representation of blacks in 1988 ranged from roughly 6 percent of mathematical and social scientists to about 1 percent of environmental scientists (based on appendix B, table 1). Among doctoral scientists and engineers in 1989, black representation ranged from 3.0 percent of social scientists to about 1 percent of physical and mathematical scientists (based on appendix B, table 3).

Blacks remain more likely than whites to be scientists rather than engineers. In 1988, 68 percent of employed black scientists and engineers were scientists, compared with 48 percent of whites. Within science fields, blacks were most likely to be social scientists or computer specialists (chart 3-2). In fact, over the decade from 1978 to 1988, the most rapid employment gains for black scientists occurred among computer specialists (up 23 percent per year) and social scientists (up about 16 percent annually). In comparison, annual employment of whites in these fields rose by 14 percent and 10 percent, respectively.

An index of dissimilarity<sup>4</sup> can be used to summarize general field differences of various groups. The index between whites and blacks was 24 in 1988; that is, about 24 percent of blacks would have to change fields to have a distribution identical to that of whites.

Among doctoral scientists and engineers, a higher proportion of blacks (91 percent) than whites (85 percent) were scientists rather than engineers in 1989 (based on appendix B, table 3).

<sup>2</sup> U.S. Department of Labor, Bureau of Labor Statistics, Employment and Earnings, vol. 38, no. 1 (Washington, DC: U.S. Government Printing Office, January 1991), p. 185.

<sup>3</sup> National Science Foundation, Science Resources Studies Division, Survey of Doctorate Recipients, 1989, unpublished tabulations, table B-67.

<sup>4</sup> U.S. Commission on Civil Rights, Social Indicators of Equality for Minorities and Women (Washington, DC: U.S. Government Printing Office, August 1978), p. 44. The index of dissimilarity is calculated by taking the difference between two percentage distributions (one for each group, and each totaling 100 percent) covering the same occupation. The sum of the absolute (disregarding the sign) difference for all occupations is divided by two and the result is the index of dissimilarity. The index...represents the percentage of a group who would have to change occupations in order for the group to have the identical distribution of a comparison group. If two groups had the same distribution of occupations, the index of dissimilarity would be 0.0."

**Chart 3-2. Field distribution of employed black and white scientists and engineers: 1988**

<sup>1</sup> Includes industrial, materials, mining, nuclear, petroleum, and other

SOURCE: Based on appendix B, table 1

Almost one-half of all blacks were social scientists (29 percent) or psychologists (19 percent). In contrast, 16 percent of whites were social scientists and 15 percent were psychologists. The index of dissimilarity between black and white doctoral scientists and engineers in 1989 was 40: 17 for scientists and 23 for engineers.

### Experience

In 1986, blacks had fewer years of professional experience than whites. Almost 40 percent of black scientists and engineers, compared with about 29 percent of whites, had fewer than 10 years of work experience (based on appendix B, table 6). Black doctoral scientists and engineers in 1989 also had fewer years of professional experience than whites (appendix B, table 9). Almost 50 percent of blacks with doctorates had fewer than 10 years of professional experience, whereas only 34 percent of whites had similar levels of professional experience.

### Career Patterns

In 1986, blacks and whites were equally likely to report management as their primary work activity. Roughly 28 percent of each racial group was engaged in some aspect of management. There were, however, some differences between scientists and engineers. Among scientists, 30 percent of blacks and 25 percent of whites were in management; for engineers, the proportions were reversed—26 percent of blacks and 31 percent of whites.<sup>5</sup>

Blacks constitute approximately 2 percent of the doctoral scientists and engineers employed in 4-year colleges and universities. Once employed, they are less likely than their white colleagues to hold tenure or to become full professors. In 1989, 49 percent of blacks and 56 percent of whites held tenure (based on appendix B, table 15). More blacks (11 percent) than whites (9 percent) were in non-tenure-track positions. In 1989, only 27 percent of blacks—but 42 percent of whites—were full professors (based on appendix B, table 18). In contrast, 33 percent of blacks and 23 percent of whites were associate professors.

### Labor Market Indicators

Black scientists report labor force experiences that are different from those of whites. Although blacks are slightly more likely than whites to be in the labor force, they are also more likely to be unemployed and underemployed.

In 1986, black scientists and engineers had a labor force participation rate of 97 percent; for whites, this rate was 94 percent. At this time, the participation rate for black scientists and engineers was much higher than that for blacks in the overall population (64 percent) or for black college graduates (87 percent) (appendix B, table 21).<sup>6</sup>

In 1990, black S&E bachelor's degree recipients who had received their degrees in 1988 or 1989 had a labor force participation rate of 97 percent (appendix B, table 23). The rate was 98 percent for black recent master's degree recipients in 1990 (appendix B, table 23) and for blacks in 1989 who had received their doctorates between 1946 and 1988 (appendix B, table 22). Participation rates for white recent graduates were about 97 percent for bachelor's and master's degree recipients and 93 percent for doctorate recipients.

Once in the labor force, blacks are more likely than whites to be unemployed. The unemployment rate for black scientists and engineers averaged 3.8 percent in 1986; this was more than twice the 1.5-percent rate for whites (appendix B, table 21).<sup>7</sup> The unemployment rate for black scientists and engineers had, however, declined from 5.9 percent in 1976.<sup>8</sup> In the

<sup>5</sup> National Science Foundation. *Women and Minorities in Science and Engineering*. NSF-90-301, January 1990, p. 29.

<sup>6</sup> *Women and Minorities*, p. 29.

<sup>7</sup> *Women and Minorities*, p. 29.

<sup>8</sup> *Women and Minorities*, p. 29.

overall U.S. work force in 1986, the unemployment rate for blacks was 11.5 percent<sup>9</sup> and the rate for black college graduates was 3.6 percent.<sup>10</sup>

The unemployment rate for black doctoral scientists and engineers was 3.7 percent in 1989, versus 0.8 percent for whites (table 3-1). In 1990, unemployment rates for black recent college graduates with bachelor's and master's degrees were 6.4 percent and 4.6 percent, respectively. At 3.0 percent for recent baccalaureate recipients and 1.6 percent for master's degree recipients, whites had unemployment rates that were less than one-half the rates for blacks. The employment outlook improved for blacks over the decade. In 1980, black recent (1978 and 1979) graduates with bachelor's degrees had an unemployment rate of 9.3 percent and those with master's degrees a rate of 12.8 percent. The comparable rates for whites were 3.3 percent and 2.0 percent, respectively.<sup>11</sup>

**Table 3-1. Selected characteristics of employed persons with degrees in science and engineering, by degree level**

Characteristics/ degree level (1)	White	Black	Asian	Native American	Hispanic (2)
<b>Unemployment rate</b>					
Bachelor's	3.0	6.4	5.6	1.5	4.4
Master's	1.6	4.6	3.3	--	4.3
Doctorate	0.8	3.7	0.7	1.5	0.8
<b>S&amp;E underemployment rate</b>					
Doctorate	1.3	2.9	0.9	1.6	1.4
<b>Median annual salary</b>					
Bachelor's	\$26,100	\$24,000	\$30,000	\$21,900	\$25,100
Master's	37,500	35,000	35,900	--	36,100
Doctorate	54,800	48,500	55,000	50,100	50,000

Double dashes (--) represent too few cases to estimate.

(1) Data for bachelor's and master's degrees were reported in 1990 by 1988 and 1989 graduates; data for doctorates were reported in 1989 by recipients who received degrees between 1946 and 1988.

(2) Includes members of all racial groups

SOURCE: Appendix B, tables 22, 23, 25, and 26

Black scientists and engineers also experience higher rates of underemployment than do whites. In 1986, the rate for blacks was 5.5 percent, compared with 2.5 percent for whites (appendix B, table 21).<sup>12</sup> This higher rate is primarily the result of greater underemployment of blacks in science fields (7.5 percent, versus 4.2 percent for whites). Across these fields, black social scientists had the highest underemployment rate (13 percent). On the other hand, underemployment rates among engineers averaged only 2 percent for blacks and 1 percent for whites. In 1989, the underemployment rate for

black doctoral scientists and engineers (2.9 percent) was more than double the rate for white doctorate holders in the same fields (1.3 percent) (table 3-1).

In 1986, black scientists and engineers earned annual salaries that were equal to 81 percent of those for whites—a difference of \$7,200 (based on appendix B, table 24). Salaries were \$31,500 for blacks and \$38,700 for whites. Annual salaries for blacks were lower than those for whites across all major S&E fields. The greatest differential occurred in the social sciences, where salaries for blacks (\$22,800) were equal to about 71 percent of those for whites.<sup>13</sup> Black doctoral scientists and engineers earned annual median salaries of about \$48,500 per year in 1989; this figure was approximately 89 percent of the median salary for white doctoral scientists and engineers (\$54,800) (appendix B, table 25). Although salaries for black Ph.D.'s continue to be lower than those of white Ph.D.'s, regardless of experience level, the difference in salaries decreases along with the number of years of professional experience. For example, in 1989, black Ph.D.'s with up to 1 year of professional experience earned salaries (\$36,400) equal to 95 percent of the salaries of white Ph.D.'s with the same level of experience (\$38,400); blacks with 10 to 14 years' experience earned amounts (\$51,100) equal to 97 percent of the salaries of whites with similar experience (\$52,600) (appendix B, table 72).

In 1990, black recent college graduates (those who received degrees in 1988 or 1989) with bachelor's degrees in science and engineering earned median salaries that were equal to 92 percent of the median salaries for whites (\$24,000 versus \$26,100) (appendix B, table 26). The median salaries of blacks who had recently received master's degrees (\$35,000) were equal to 93 percent of the median salaries earned by whites (\$37,500).

## ASIANS IN SCIENCE AND ENGINEERING

### Employment Levels and Trends

Between 1978 and 1988, employment of Asian scientists and engineers increased faster than did employment of whites—146 percent (9 percent per year) versus 97 percent (7 percent per year) (appendix B, table 1). In 1988, the approximately 268,000 Asian scientists and engineers accounted for about 5 percent of the total S&E work force. In contrast, Asians constitute only about 2 percent of the overall U.S. work force and only 3 percent of those in professional fields.<sup>14</sup>

Over the decade from 1979 to 1989, employment gains by Asian doctoral scientists and engineers outpaced those by whites. Employment of Asians rose by 80 percent (6 percent per year) over the decade, while that of whites increased by

<sup>9</sup> Employment and Earnings, vol. 38, p. 54.

<sup>10</sup> U.S. Department of Labor, Bureau of Labor Statistics, unpublished tabulations.

<sup>11</sup> National Science Foundation, Division of Science Resources Studies, 1980 New Entrants Survey, unpublished tabulations, table B-51.

<sup>12</sup> Women and Minorities, p. 29.

<sup>13</sup> Women and Minorities, p. 29.

<sup>14</sup> U.S. Bureau of the Census, General Social and Economic Characteristics, United States Summary, 1980 Census of the Population (Washington, DC: U.S. Government Printing Office, 1983).

only about 39 percent (slightly over 3 percent per year) (based on appendix B, table 3). In addition, Asian representation among doctoral scientists and engineers is higher than their representation among all scientists and engineers. In 1989, 9.2 percent (41,239) of employed doctoral scientists and engineers were Asian, up from 7.3 percent (22,932) in 1979. Asians constituted 7 percent of the employed doctoral scientists and 20 percent of the engineers.

Among doctoral scientists and engineers employed in 1989, roughly 68 percent of Asians—compared with 97 percent of whites—were U.S. citizens. Of those who were U.S. citizens, about 15 percent of Asians but 93 percent of whites were native-born.<sup>15</sup>

### Field

Asians are somewhat more likely than whites to be engineers rather than scientists. About 56 percent of Asians and 52 percent of whites in science and engineering were engineers in 1988. Asian scientists are most likely to be computer specialists and least likely to be environmental scientists (chart 3-3). The index of dissimilarity between Asians and whites was 16 in 1988; that is, 16 percent of Asians would have to change fields to have a distribution similar to that for whites.

Over the decade from 1978 to 1988, employment of Asian scientists increased more rapidly than did that of Asian engineers (12 percent versus 8 percent per year) (based on appendix B, table 1). For whites, employment of engineers rose at an annual rate of almost 6 percent and that of scientists increased at a 9-percent rate. Among Asian scientists, the fastest growing fields were computer specialties (up about 19 percent per year, to almost 50,000) and the mathematical sciences (up about 20 percent per year, to 9,200).

The field distribution of Asian doctoral scientists and engineers differs from that of whites. Only 65 percent of Asians, but 86 percent of whites, were scientists rather than engineers in 1989 (based on appendix B, table 3). Of the Asian doctoral scientists, more than 60 percent were either life scientists (35 percent) or physical scientists (27 percent). The employment of Asian scientists and engineers increased over the decade from 1979 to 1989 at about the same rate (6 percent). For whites, employment increases among scientists and engineers were 3.3 percent and 3.5 percent, respectively. The index of dissimilarity between Asian and white doctoral scientists and engineers was 29 in 1989—19 percent for scientists and 10 percent for engineers.

### Experience

Asian and white scientists and engineers reported a similar number of years of professional experience in 1986. For example, over 30 percent of both whites and Asians had fewer than 10 years' work experience (based on appendix B, table 6). Among doctoral scientists and engineers in 1989, Asians

**Chart 3-3. Field distribution of employed Asian and white scientists and engineers: 1988**

<sup>1</sup> Includes industrial, materials, mining, nuclear, petroleum, and other  
SOURCE: Based on appendix B, table 1

had fewer years of experience, on average, than did whites. About 43 percent of Asian Ph.D.'s had fewer than 10 years of professional experience; the comparable figure for whites was about 34 percent (based on appendix B, table 9).

### Career Patterns

Asians are less likely than whites to be in management. About 28 percent of whites, but only 22 percent of Asians, reported management as their major work activity.

The tenure status and academic rank of Asian scientists and engineers also differ from those of whites. Among doctoral scientists and engineers in 4-year colleges and universities, Asians are less likely than whites to hold tenure: In 1989, roughly 43 percent of Asians, compared with 56 percent of whites, held tenure (based on appendix B, table 15). A higher proportion of Asians (12 percent) than whites (9 percent) were in non-tenure-track positions.

Asians and whites also show some differences in measures of academic rank. Among doctorate holders in 1989, 35 percent

<sup>15</sup> Survey of Doctorate Recipients, 1989, unpublished tabulations, table B-67.

of Asians and 42 percent of whites were full professors; at the associate level, the proportion was 19 percent for Asians and 23 percent for whites (based on appendix B, table 18).

### Labor Market Indicators

Labor market conditions are roughly the same for both Asian and white scientists and engineers. Asians were slightly more likely than whites to be in the labor force in 1986; however, they had a slightly higher unemployment rate.

The 96-percent labor force participation rate for Asians in 1986 (the latest year for which data are available) was slightly above that for whites (94 percent) (appendix B, table 21).<sup>16</sup> The rate for Asians, however, had fallen since 1976, when it was 99 percent. In the overall U.S. population, Asians had a labor force participation rate of roughly 70 percent.<sup>17</sup>

The 1990 labor force participation rate for Asians who had received bachelor's and master's degrees in science and engineering in 1988 and 1989 was 96 percent (appendix B, table 23). White recent bachelor's and master's degree recipients had slightly higher rates (over 97 percent). The participation rate for Asian doctoral scientists and engineers, 97 percent, was higher than the 93-percent rate for whites (appendix B, table 22).

Among doctoral scientists and engineers, the unemployment rate for Asians in 1989 was about the same as that of whites, roughly 1.0 percent (table 3-1). Asian recent bachelor's and master's degree recipients had higher rates of unemployment than did whites. Asians with S&E bachelor's degrees had a rate of 5.6, versus 3.0 percent for whites; the rate for master's degree recipients was 3.3 percent, versus 1.6 percent for whites.

Only 2.2 percent of Asian scientists and engineers were underemployed in 1986 (appendix B, table 21). The corresponding rate for whites was 2.5 percent. The S&E underemployment rate for Asians varied by field; for example, Asian scientists had a rate of 3.5 percent, and Asian engineers had a rate of 1.2 percent. Asian doctoral holders in 1989 had an underemployment rate of about 1 percent, whereas whites had a slightly higher rate of 1.3 percent (appendix B, table 22).

Asian and white scientists and engineers earned roughly similar salaries in 1986—\$39,100 for Asians and \$38,700 for whites (appendix B, table 24). Although Asian and white engineers earned approximately equal salaries, among scientists, Asians' salaries averaged 103 percent of those for whites.

Asians who earned bachelor's degrees in S&E fields in 1988 and 1989 had median annual salaries of \$30,000 in 1990 (appendix B, table 26). This was 115 percent of the median salaries for whites (\$26,100) in the same S&E fields. This

difference between Asian and white median salaries can be attributed largely to the higher salaries of Asians with bachelor's degrees in science fields. Asians with bachelor's degrees in science earned median salaries of \$27,900, versus \$23,000 for whites; median salaries for Asian and white graduates with bachelor's degrees in engineering were almost equal—\$32,800 for Asians and \$33,300 for whites.

Asian graduates with master's degrees earned median annual salaries of \$35,900, equal to 96 percent of the median salary earned by whites (\$37,500). At the Ph.D. level in 1989, median salaries for Asians (\$55,000) were slightly higher than those of whites (\$54,800) (appendix B, table 25).

As the years of professional experience increased for Asian S&E doctorate holders, so did the difference in their salaries relative to those of white S&E doctorate holders. For example, in 1989 Asians with up to 1 year of professional experience made, on the average, 6 percent more than whites; those with 2 to 4 years, 8 percent more; and those with 5 to 9 years, 10 percent more (appendix B, table 72).

### NATIVE AMERICANS IN SCIENCE AND ENGINEERING

Data for Native Americans should be viewed with some caution, because sample sizes for Native Americans are very small; statistical reliability is thus lower for data on Native Americans than for data on other groups.<sup>18</sup> In addition, for Native Americans, estimates both for scientists and engineers and for the overall U.S. labor force are based on self-reported data. Individuals' willingness to report themselves as Native Americans may have varied over time.

#### Employment Levels and Trends

In 1988, the approximately 22,000 employed Native American scientists and engineers represented less than 1 percent of the S&E work force (appendix B, table 1). This percentage was similar to their representation both in the overall U.S. work force and in professional specialty fields.<sup>19</sup>

There are relatively few Native Americans in the doctoral S&E work force. In 1989, about 780 doctoral scientists and engineers were Native American, up from about 400 in 1979 (appendix B, table 3).

<sup>16</sup> Women and Minorities, p. 31.

<sup>17</sup> Women and Minorities, p. 31.

<sup>18</sup> See appendix A, "Technical Notes," for a discussion of the statistical reliability of the estimates of scientists and engineers.

<sup>19</sup> Women and Minorities, p. 31.

## Field

There are certain differences in the field distributions of Native Americans and whites (chart 3-4). For example, Native Americans are somewhat more likely than whites to be engineers rather than scientists. In 1988, 60 percent of Native Americans and 52 percent of whites were engineers. On the other hand, Native American doctoral scientists and engineers were more highly concentrated in the sciences than in engineering in 1989 (89 percent versus 11 percent) (based on appendix B, table 3). This field distribution has changed somewhat since 1979, when 92 percent of Native Americans with doctorates were scientists. Within the sciences in 1989, half the Native American Ph.D.'s were either life scientists (26 percent) or social scientists (24 percent).

## Experience

In 1986 Native Americans, on average, reported more years of professional experience than did whites. About 20 percent of Native Americans—compared with 30 percent of whites—reported less than 10 years' work experience (based on appendix B, table 6).<sup>20</sup> In 1989, over 48 percent of employed

**Chart 3-4. Field distribution of employed Native American and white scientists and engineers: 1988**

<sup>1</sup> Includes industrial, materials, mining, nuclear, petroleum, and other

SOURCE: Based on appendix B, table 1

<sup>20</sup> Women and Minorities, p. 32.

Native American doctoral scientists and engineers reported fewer than 10 years of professional work experience, compared with 34 percent for whites (based on appendix B, table 9).

## Career Patterns

Native Americans represent less than 1 percent of all doctoral scientists and engineers employed in 4-year colleges and universities. At the colleges and universities, Native Americans are less likely (49 percent) than whites (56 percent) to hold tenure (based on appendix B, table 15). About 32 percent of Native Americans and 42 percent of whites were full professors in 1989; 28 percent of Native Americans and 23 percent of whites were at the associate professor level (based on appendix B, table 18).

## Labor Market Indicators

Native American scientists and engineers generally experience favorable labor market conditions. In 1986, they were more likely than whites to be in the labor force and less likely to be unemployed or underemployed.<sup>21</sup>

In 1986, Native American scientists and engineers had a labor force participation rate of 96 percent; for whites, the rate was 94 percent (appendix B, table 21). Among those in the labor force, 1.2 percent of Native Americans and 1.5 percent of whites were unemployed.

In 1990, recent Native American S&E graduates (those who had received bachelor's and master's degrees in 1988 and 1989) had a labor force participation rate of 100 percent (appendix B, table 23). The comparable rate for whites was 97 percent. Among Native American Ph.D.'s in 1989, the labor force participation rate was 95 percent, compared with 93 percent for whites (appendix B, table 22). The underemployment rate for Native American Ph.D.'s was 1.6 percent; the rate for whites was 1.3 percent.

Data on annual salaries contrast with other indicators, showing less favorable labor market conditions for Native Americans than for whites. In 1989, Native American recent bachelor's degree recipients earned a median annual salary that was 84 percent of that of whites (\$21,900, compared with \$26,100 for whites) (table 3-1). At the doctoral level, the median annual salary reported by Native Americans in 1989 was \$50,100, which was 91 percent of the median salary for whites (\$54,800).

<sup>21</sup> Women and Minorities, p. 32.

## HISPANICS IN SCIENCE AND ENGINEERING

It is desirable to differentiate among Mexican Americans, Puerto Ricans, and other Hispanics, because socioeconomic backgrounds and reasons for underrepresentation may vary among these groups. Because of data limitations, however, most of this discussion treats Hispanics in the aggregate.

In 1988, about 29 percent of employed Hispanic scientists and engineers were Mexican American and 12 percent were Puerto Rican. The remaining 59 percent were "other Hispanic" (53 percent) or did not report their specific Hispanic origins (6 percent).<sup>22</sup> In the total U.S. work force in 1988, about 57 percent of Hispanics were Mexican American and 10 percent were Puerto Rican.<sup>23</sup> In 1990, about 62 percent of Hispanics in the overall U.S. work force were Mexican American, 9 percent were Puerto Rican, and 6 percent were Cuban.<sup>24</sup>

### Employment Levels and Trends

Hispanics remain underrepresented in science and engineering. The approximately 96,000 Hispanic scientists and engineers employed in 1988 represented only 1.8 percent of all scientists and engineers (based on appendix B, table 1). In comparison, roughly 7.2 percent of all employed persons in the United States in 1988 were Hispanics, as were 3.4 percent of those in professional and related occupations. About 11 percent of Hispanic scientists and engineers were non-U.S. citizens; the comparable figure for all scientists and engineers was about 3 percent. Among all Hispanics in the United States, about 20 percent were not U.S. citizens.<sup>25</sup>

In 1990, Hispanics' representation in the U.S. labor force had increased slightly from its 1988 level, to 7.7 percent,<sup>26</sup> but the proportion of Hispanic workers in professional and other occupations had decreased to 3.3 percent.<sup>27</sup>

Hispanics are also underrepresented among doctoral scientists and engineers. In 1989, the 8,094 Hispanic doctoral scientists and engineers accounted for 1.8 percent of all doctoral scientists and engineers; their employment was up from 4,155 (1.3 percent) in 1979 (appendix B; table 3). Among Hispanic doctoral scientists and engineers, about 20 percent were not U.S. citizens in 1989; an additional 25 percent were foreign-born but held U.S. citizenship.<sup>28</sup>

## Field

There are relatively small differences between the field distributions of Hispanic scientists and engineers and all scientists and engineers; the index of dissimilarity was only 11 in 1988. In 1988, about 54 percent of Hispanic scientists and engineers and 51 percent of all scientists and engineers were engineers (based on appendix B, table 1). Among fields, Hispanics are somewhat more likely to be life scientists and less likely to be computer specialists (chart 3-5). In 1989, Hispanic Ph.D.'s (16 percent) and all Ph.D.'s (17 percent) were about equally likely to be engineers (based on appendix B, table 3).

Chart 3-5. Field distribution of employed Hispanic and all scientists and engineers: 1988

<sup>1</sup> Includes industrial, materials, mining, nuclear, petroleum, and other

SOURCE: Based on appendix B, table 1

<sup>22</sup> The "other Hispanic" category includes individuals whose origins are in Spain or the Spanish-speaking countries of Central or South America. Also included in this category are those who identified themselves as Spanish, Spanish American, Hispano, Latino, etc.

<sup>23</sup> Employment and Earnings, vol. 34, p. 202.

<sup>24</sup> Employment and Earnings, vol. 38, p. 209.

<sup>25</sup> Women and Minorities, p. 32.

<sup>26</sup> Employment and Earnings, vol. 38, p. 208.

<sup>27</sup> Employment and Earnings, vol. 38, p. 210.

<sup>28</sup> Survey of Doctorate Recipients, unpublished tabulations, table B-67.

## Experience

In 1986, Hispanics reported significantly fewer years of professional experience than did all scientists and engineers. About 44 percent of Hispanics reported fewer than 10 years' experience; the comparable figure for all scientists and engineers was 31 percent (appendix B, table 6).<sup>29</sup> Among doctoral scientists and engineers in 1989, a higher proportion of Hispanics than of all scientists and engineers had fewer than 10 years of work experience (52 percent versus 35 percent) (based on appendix B, table 9).

## Career Patterns

There is little difference between the proportions of Hispanic scientists and engineers and all scientists and engineers who report management as their primary activity. In 1986, these proportions were 26 percent and 28 percent, respectively.<sup>30</sup>

There are some notable differences within educational institutions between Hispanic and all doctoral scientists and engineers regarding tenure status and professional rank. In 1989, 41 percent of Hispanics and 55 percent of all scientists and engineers held tenure (appendix B, table 15). Among Hispanics, about 21 percent were full professors; the comparable figure for all doctoral scientists and engineers was 41 percent (based on appendix B, table 18).

## Labor Market Indicators

Hispanic scientists and engineers faced labor market conditions that differed somewhat from those for all scientists and engineers in 1986. Although Hispanics were as likely as all scientists and engineers to be in the labor force, they were more likely to be unemployed and underemployed.

The labor force participation rate for both Hispanic scientists and engineers and all scientists and engineers was 95 percent in 1986 (appendix B, table 21). The participation of Hispanic scientists and engineers in the labor force was well above the 65-percent rate for the overall Hispanic population;<sup>31</sup> it was also significantly higher than the 84-percent rate for Hispanic college graduates.<sup>32</sup>

The unemployment rate for Hispanic scientists and engineers (2.1 percent) in 1986 was higher than that for all scientists and engineers (1.5 percent; appendix B, table 21). At the doctoral level, the unemployment rate for Hispanics was similar to that for all scientists and engineers—about 1 percent in 1989 (table 3-1). The unemployment rates in 1990 for recent Hispanic bachelor's and master's degree recipients (degree received in 1988 or 1989) were 4.4 percent and 4.3 percent, respectively. At both levels, the unemployment rate was higher than the rate for all S&E graduates, which was 3.4 percent for those with bachelor's degrees and 1.8 percent for master's degrees (appendix B, table 23).

Hispanic scientists and engineers, on average, experience a higher degree of underemployment than do all scientists and engineers (appendix B, table 21). The underemployment rate for Hispanics in 1986 was 4.8 percent, compared with 2.6 percent for all scientists and engineers. Among Ph.D.'s, the underemployment rate in 1989 was 1.4 percent for Hispanics and 1.3 percent for all scientists and engineers (table 3-1).

In 1986, salaries for Hispanic scientists and engineers averaged 90 percent of those earned by all scientists and engineers (\$34,600 versus \$38,400) (appendix B, table 24).<sup>33</sup> Annual median salaries for recent Hispanic S&E bachelor's degree recipients (degree received in 1988 or 1989) averaged 97 percent of those earned by all recent S&E bachelor's degree recipients (\$25,100 versus \$26,000) (table 3-1). The median salary for recent Hispanic graduates with bachelor's degrees in engineering was 98 percent of that for all recent recipients of engineering baccalaureates; for degrees in science, the salary ratio was 92 percent. Similarly, recent Hispanic S&E master's degree recipients earned 98 percent of the salaries earned by all S&E graduates with master's degrees. Hispanic doctoral scientists and engineers earned approximately 92 percent of the salaries for all doctoral scientists and engineers (\$50,000 versus \$54,600) in 1989.

# *education and training of minorities in science and engineering*

## OVERVIEW

The educational experiences of minorities differ extensively from each other and from those of the majority. These differences show up early. For instance, compared with whites, blacks and Hispanics tend to take fewer courses in mathematics and science, and Asians take more of these courses. One indication of this lower participation for blacks and Hispanics is their performance on mathematics and science skills assessments. These groups score lower than average as early as age 9, and the greatest differences occur by age 17.

Differing rates of participation in mathematics and science training in elementary and secondary school are partially reflected in scores on the mathematics portion of the Scholastic Aptitude Test (SAT). Although scores for blacks and Hispanics are below average by roughly 40 to 90 points, scores for Asians are consistently higher than average by almost 50 points.

Progress is evident for minorities, nonetheless, especially for blacks. Between 1973 and 1990, scores on precollege assessments of mathematics and science skills have increased much more sharply for blacks than for the majority. In addition, the SAT mathematics scores of blacks have increased at above-average levels over the decade.

Differences in participation in mathematics and science may reflect several factors, one of which is opportunity. Minority groups, especially blacks and Hispanics, come from socioeconomic backgrounds that are very different from those of the majority. For example, family incomes reported by black and Hispanic freshmen are much lower than the overall average, and these students must rely heavily on grants and scholarships to finance their education. Furthermore, the average level of education is much lower for the parents of these students than for the parents of all students; parents of minority students are much less likely to hold an undergraduate degree. Finally, high school grade point averages (GPAs) are lower for minorities, especially for blacks. On a more positive note, however, these students plan to study to the graduate and professional level to a greater than average extent.

S&E bachelor's degree production has slowed nationally over the decade from 1979 to 1989. For minority groups this trend

has translated into a decline in bachelor's degrees awarded to blacks, a small increase for Native Americans, and a modest increase (34 percent) for Hispanics. Asians, however, earned degrees at a much faster rate than did underrepresented minorities over this time period (178 percent increase).

Doctorate production in science and engineering has slowed for minorities among U.S. citizens. The number of doctorates awarded to black U.S. citizens has fallen over the decade, and the number awarded to Asians increased by 40 percent. The number of Hispanic U.S. citizens earning doctorates more than doubled.

## BLACKS

### Precollege Preparation<sup>1</sup>

#### *Mathematics and Science Achievement*<sup>2</sup>

**Mathematics.**<sup>3</sup> Blacks scored below whites at all three age levels (9, 13, and 17 years) on the mathematics assessment tests given in 1990. The 1990 scores follow the trend of scores for the previous 3 test years (1978, 1982, and 1986): The gap in scores has narrowed since 1973. Assessment scores in 1990 were closest for blacks and whites in the 17-year-old group, unlike in 1986, when the gap in scores was largest in this age group. In the 1973, 1978, and 1982 assessments, the largest average difference in performance by blacks and whites was at the 13-year-old level.

*Nine-year-olds.* On the most recent assessment (1990), the difference in overall mean scores for blacks and whites was about 27 points (208.4 versus 235.2). This difference has diminished since 1973—when it was almost 35 points—as a result of an increase in scores for blacks (up from 190.0 in 1973). For the past 5 test years, whites have scored an average of approximately 30 points more than blacks on each test.

<sup>1</sup> For explanations and definitions of the data sets and examinations used in this section, see chapter 2, "Education and Training of Women in Science and Engineering."

<sup>2</sup> The assessments conducted by the National Assessment of Educational Progress use a common scale of 0 to 500. Within this scale, proficiency in a subject is broken into five levels.

<sup>3</sup> Figures for mathematics assessments scores are taken from table 27 in appendix B of this report.

In 1990, there were differences in the levels of proficiency achieved by blacks and whites. A slightly lower percentage of blacks (97 percent) than whites (99 percent) scored at or above the lowest level, 150 (simple arithmetic facts). As the levels increase, so do the differences in percentages. Thus, only about 9 percent of blacks, compared with 33 percent of whites, scored at or above the 250 level (basic operations and problem solving).

*Thirteen-year-olds.* The variation in scores for blacks at this age was similar to that of 9-year-olds. An average of 27 points separated the overall means for blacks (249.1) and whites (276.3) in 1990. This gap has narrowed considerably since 1973, when it was 46 points. This is the result of an increase in scores of black 13-year-olds by an average of 21 points since 1973. Blacks have scored an average of 35 points lower than whites over the last five test periods.

Levels of proficiency continue to vary between blacks and whites. For example, about 49 percent of blacks, but 82 percent of whites, scored above the 250 level (basic operations and problem solving). The proportions scoring at or above level 300 (moderately complex procedures and reasoning) were 4 percent and 21 percent, respectively.

*Seventeen-year-olds.* The overall mean score for blacks in 1990 was 288.5, 21 points lower than that for whites (309.5). This gap has diminished substantially since 1973, when it was 40 points. Over the last five test periods, the mean scores of blacks have been an average of 32 points lower than those of whites.

All students in this age group, black and white, scored at or above the 200 level (beginning skills and understanding). As the levels of proficiency increased, so did the differences between the groups. The proportions scoring above 250 (basic operations and problem solving) were 92 percent for blacks and 98 percent for whites. The proportions scoring above 300 (moderately complex procedures and reasoning) were 33 percent and 63 percent, respectively. At the highest level, level 350 (multistep problem solving and algebra), 2 percent of black students and 8 percent of whites scored at or above proficiency.

**Science.**<sup>4</sup> The pattern of progress on the science assessment has been similar to that exhibited on the mathematics series (appendix B, table 27). The mean scores of blacks are lower than those for whites at all age levels, especially among 17-year-olds. Progress by blacks since 1973 has begun to close the gap, however.

*Nine-year-olds.* The overall mean score of blacks in 1990 was about 41 points lower than that of whites (196.4 versus 237.5). Since 1973, though, the mean score of blacks has risen from 176.5, which was 55 points lower than the mean score of

whites (231.1). Over the last five test periods, blacks have scored an average of 46 points lower than whites.

Differences in levels of proficiency show up early and increase with proficiency level. In 1990, 88 percent of blacks, compared with 99 percent of whites, scored at or above the 150 level (knowledge of everyday facts). The proportions scoring at or above level 200 (understanding simple scientific principles) were 46 percent (blacks) and 84 percent (whites).

*Thirteen-year-olds.* Differences in scores have also narrowed for this age group. In 1973, blacks' average scores were 53 points lower than those of whites; in 1990, the difference was 38 points (225.7 versus 264.1). On the average, blacks scored 44 points lower than whites over the last five assessment periods.

For this age group, proficiency gaps begin to appear at the lowest levels. About 78 percent of blacks, compared with 97 percent of whites, scored at or above the 200 level (simple principles). For scores at or above the 250 level (application of basic scientific knowledge), the proportions were 24 percent and 67 percent, respectively.

*Seventeen-year-olds.* The largest difference in mean scores between blacks and whites was for this age group. In 1990, blacks scored 253.0, which was 48 points lower than the score of whites (300.9). In 1973, however, the difference was more than 53 points. The average difference between black and white assessment scores for the last five assessments was 52 points.

Substantial differences between blacks and whites exist at all levels of proficiency. These differences are most acute in the upper ranges. In 1990, roughly 16 percent of blacks and 51 percent of whites scored at or above the 300 level (analyses of procedures and data). Proportions scoring at or above the level 350 (integration of specialized scientific knowledge), the highest level, were 2 percent and 11 percent, respectively.

### *Characteristics of College-Bound Seniors*

**Coursework.** Data for college-bound seniors who take the SAT show that about the same percentages of blacks and whites take introductory-level mathematics (algebra) and science (biology) courses in high school, but that wide disparities begin to emerge at more advanced levels (appendix B, table 29). In 1990, almost all seniors, both black (95 percent) and white (97 percent), had taken algebra, but more whites than blacks had taken geometry, trigonometry, or calculus. For example, 86 percent of blacks had taken geometry, 43 percent trigonometry, and 9 percent calculus; in comparison, 94 percent, 56 percent, and 19 percent of whites had taken geometry, trigonometry, and calculus, respectively. In addition, about 13 percent of blacks, compared with 24 percent of whites, had been enrolled in an honors math course.

Science coursework parallels this trend. Over 95 percent of both black (96 percent) and white (97 percent) students had taken biology, but 32 percent of blacks and 44 percent of

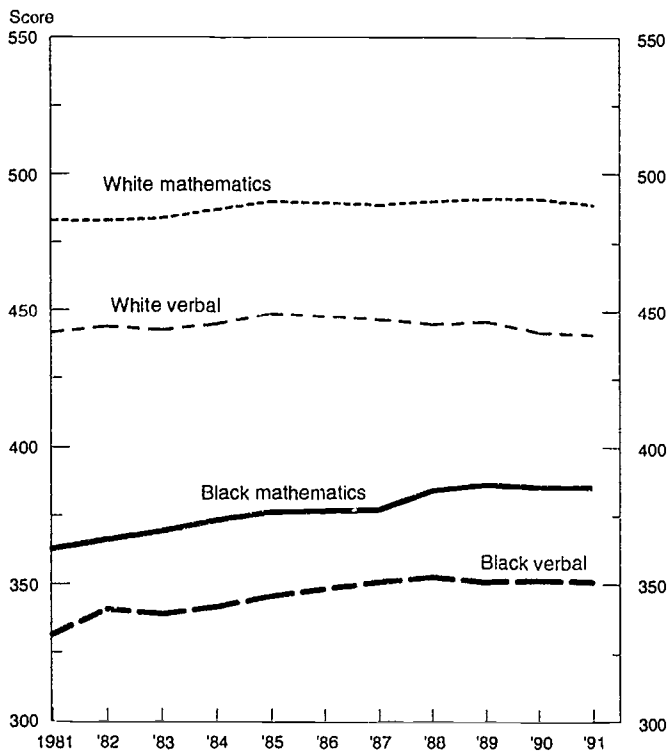

<sup>4</sup> Figures for science assessment scores are taken from table 28 in appendix B of this report.

whites reported having taken a physics course. Likewise, fewer blacks (13 percent) than whites (23 percent) had taken an honors science course.

**SAT Scores.** In 1991, almost 100,200 blacks took the SAT, accounting for about 10 percent of the total. A majority of these test-takers (58 percent) were female.<sup>5</sup>

Although blacks continued to score lower than whites on both components of the SAT in 1991, the differences narrowed during the decade from 1981 to 1991, largely because the scores of blacks increased while there was little change in the scores of whites (chart 4-1). In 1991, the mean verbal score for blacks was 351—90 points lower than the mean score of 441 for whites. In 1981, however, the difference in scores was 110 points (332 points for blacks versus 442 points for whites).

**Chart 4-1. SAT scores of black and white college-bound seniors: 1981-91**

NOTE: The score range is 200 to 800. Data are not available for 1986.  
SOURCE: Appendix B, table 30

Similar progress is evident on the mathematics component. The point difference between the scores of blacks (385) and whites (489) was 104 in 1991, down from 121 in 1981. Blacks scored 362 in 1981, compared with 483 for whites.

Despite this overall progress, there has been little change in the percentile rankings of SAT scores for blacks. Less than 1 percent of blacks—versus about 3 percent of whites—scored above 650 on the verbal component in 1991 (appendix B, table

31). Similarly, fewer blacks (21 percent) than whites (36 percent) scored between 400 and 499.

This pattern is the same on the math portion of the exam. In 1991, only 1 percent of blacks, but 10 percent of whites, scored above 650. About 26 percent of blacks, compared with 29 percent of whites, scored between 400 and 499.

**Achievement Test Scores.** Blacks constitute about the same proportion of science and mathematics achievement test-takers as they do of all achievement test-takers. Science and math achievement tests are offered in biology, chemistry, physics, and mathematics level I and level II. In 1991, about 4 percent of seniors who had taken one or more of the science and math tests were black and 61 percent were white.<sup>6</sup> Scores for blacks, however, were lower on each of the five exams by 68 to 74 points (appendix B, table 32). The highest score for blacks (596) was on the mathematics level II test; their lowest score (486) was on the mathematics level I test. The highest score for whites (667) was also on the mathematics level II test, and their lowest score (554) was on the mathematics level I test.

SAT mathematics scores for blacks and whites who took one or more of these exams were above the SAT national average in math of 474; however, blacks' scores were lower than whites' (appendix B, table 32). For blacks, the range in SAT scores was from 494 for those who took the mathematics level I test to 592 for those who took the physics test. For whites, the range was 578 (mathematics level I) to 670 (physics).

**Advanced Placement Examinations Scores.** About 4 percent of all advanced placement examinations (17,320 of 480,696) were taken by blacks and 70 percent (338,863) were taken by whites in 1990.<sup>7</sup> Percentages for science, mathematics, and computer science tests were about the same for blacks, but were slightly lower for whites: about 3 percent of the science, mathematics, and computer science tests were taken by blacks, whereas roughly 68 percent of the tests were taken by whites.<sup>8</sup>

Mean scores for blacks on advanced placement science and mathematics/computer science tests were lower than those for whites, and, in 1990, generally fell in the upper 1 (no recommendation for credit) to the mid 2 (possibly qualified for credit) range (table 4-1). Blacks' highest score was 3.08, on the mathematics/calculus BC exam. For whites, the highest score was 3.65, on the mathematics/calculus BC exam. Since the mid-eighties, scores for both blacks and whites have shown a steady decline on most of the science and mathematics/computer science tests.<sup>9</sup> The fields in which these declines were most evident were biology and physics C-mechanics.

Computer science AB	2.04	2.88
Computer science A	1.80	3.00

SOURCE: Appendix B, table 33

**Intended Undergraduate Major.** The same percentages of blacks and whites (24 percent) intended to major in a science field in 1991 (appendix B, table 34). Substantial differences exist by field. For example, 83 percent of blacks who intended to major in science chose either computer or social sciences. For whites, the proportion planning to major in one of these

**Chart 4-2. SAT mathematics scores for black and white college-bound seniors, by intended S&E major: 1991**

NOTE: The score range is 200 to 800.

SOURCE: Appendix B, table 34

fields was 63 percent. The pattern in SAT math scores for those seniors planning undergraduate majors in science was similar to overall trends: blacks scored lower than whites, regardless of intended field of study (chart 4-2). The largest difference (368 versus 508) was for students who intended to major in computer science.

About 11 percent of blacks intended to major in engineering in 1991, compared with 10 percent of whites (appendix B, table 34). Since the early eighties, this percentage has remained relatively stable for blacks but has fallen steadily among whites. There was also some narrowing in the score differential on the mathematics exam for blacks and whites intending to major in engineering. In 1991, scores for blacks (442) were 127 points lower than those for whites (569); in 1978, the difference was 139 points.<sup>10</sup>

## Undergraduate Education

### *Characteristics of American Freshmen*<sup>11</sup>

**Grade Point Average.** There are very large differences in the self-reported high school GPAs of blacks and whites. Only approximately one-third as many blacks as whites in the 1990 freshman class said their GPA was in the A range (11 percent versus 32 percent). A much larger percentage of blacks reported their grades as C or below (32 percent, compared with 11 percent for whites). The proportions of black and white freshmen reporting GPAs in the A range in 1980 were similar: 10 percent of blacks and 29 percent of whites.

**Degree Aspirations.** In 1990, about 17 percent of blacks, compared with 14 percent of whites, planned to obtain a doctorate. Likewise, higher proportions of blacks (15 percent) than whites (13 percent) planned either a law or medical degree. The baccalaureate, on the other hand, was the highest degree planned by 23 percent of blacks and 29 percent of whites, and 39 percent of blacks and 41 percent of whites intended to earn a master's degree.

**Level of Parents' Education.** The level of parental education is somewhat lower for blacks than whites, although the differences are narrower for mothers than for fathers. Slightly less than a third of both black and white freshmen reported that their mothers were high school graduates; 16 percent of blacks and 23 percent of whites indicated that their mothers held a college degree. Differences in the educational level attained by their fathers are much more striking between blacks and whites. For example, 35 percent of black fathers were high school graduates and another 14 percent held college degrees or some graduate education. For whites, these percentages were 23 percent and 25 percent, respectively.

<sup>10</sup> Women and Minorities, p. 38.

<sup>11</sup> Data by racial/ethnic group are not reliable for those whose probable major is a science or engineering field because of very small sample sizes. Therefore, data in this chapter for American freshmen reflect the characteristics of all freshmen. Data are from unpublished tabulations from the American Freshman Norm Survey. See table 35 in appendix B of this report for figures used in this section; except for information on plans for financial aid.

**Annual Parental Income.** The distribution of estimated parental income shows black income concentrated at lower levels than that of whites (appendix B, table 35). Roughly 35 percent of black freshmen, but only 9 percent of whites, gave their parents' income at less than \$20,000 per year. At the other end of the spectrum, 7 percent of blacks and 23 percent of whites reported household incomes in excess of \$75,000.

**Plans for Financial Aid.** In 1990, black freshmen were financing their educations through grants and loans to a greater extent than were whites. Pell grants were a much more common source of aid for blacks than for whites: about 43 percent of blacks, compared with 16 percent of whites, received assistance from this source. Moreover, a lower percentage of blacks than of whites cited either personal savings (64 percent of blacks, 100 percent of whites) or support from relatives (74 percent of blacks, 85 percent of whites) as one of their sources of funding. Federal student loan programs (National Direct and Federal Guaranteed) were reported by 41 percent of blacks and 27 percent of whites.

**Intended Career.** Black freshmen were more likely than white freshmen to choose professional or business careers (chart 4-3). For example, about 12 percent of blacks planned to be business managers, 9 percent wanted to be engineers, and 9 percent wanted to practice law. For whites, these proportions were 10 percent, 8 percent, and 6 percent, respectively. Blacks were less likely than whites to choose elementary or secondary school teaching as their intended profession (7 percent versus 10 percent).

**Figure 4-3. Intended career choices of black and white freshmen, by selected occupation: 1990**

SOURCE: Appendix B, table 36

## Graduate Record Examination<sup>12, 13</sup>

In 1987, about 6 percent of Graduate Record Examination (GRE) test-takers who had majored in a science or engineering field were black. Blacks constituted 5 percent of all students who took the GRE. The trend in GRE scores for blacks and whites mirrored that in SAT scores: although blacks continued to score lower than whites on each of the components, the gap had narrowed (table 4-2).

On the verbal component, the overall score for blacks in 1987 was 386, about 130 points lower than that of whites (516). In addition, scores for blacks who majored in science or engineering at the undergraduate level were lower than those for whites, regardless of field. Differences ranged from 96 points (engineering) to 130 points (social science) in 1987. These differences, however, were smaller than they had been in previous years. In 1979, for example, scores for blacks who majored in biological science were 163 points lower than those of whites; by 1987, the difference was 123 points.

Progress has also been made by blacks on the quantitative component of the GRE exam. In 1987, blacks' average score was 390—151 points lower than that of whites (541). This gap

**Table 4-2. GRE scores for black and white test-takers, by undergraduate major: 1987**

Component and field	Black	White
<b>Verbal</b>		
Physical science	422	546
Mathematical science	371	537
Biological science	404	527
Behavioral science	401	528
Social science	358	488
Engineering	436	532
<b>Quantitative</b>		
Physical science	499	645
Mathematical science	472	673
Biological science	428	581
Behavioral science	382	522
Social science	346	495
Engineering	579	688
<b>Analytical</b>		
Physical science	468	608

Biological science	432	582
Behavioral science	409	551
Social science	379	526
Engineering	502	626

NOTE: The score range is 200 to 800 for each component.  
SOURCE: Appendix B, table 37

<sup>12</sup> Data for GRE test-takers are for U.S. citizens only. See chapter 2, "Education and Training of Women in Science and Engineering," for a description of this examination series.

<sup>13</sup> GRE data more recent than 1987 were unavailable in the format needed to update this report; therefore, this section is the same as in the 1990 report. Figures for S&E majors are from unpublished tabulations by the National Science Foundation, Division of Science Resources Studies.

has narrowed from 162 points 8 years earlier. By S&E major, differences in scores vary tremendously. For instance, blacks who majored in mathematical science scored more than 200 points lower than did whites (472 versus 673), but the difference among engineering majors was 109 points (579 versus 688).

Scores for blacks on the analytical component have also shown significant improvement since the late seventies, although blacks continued to score lower than whites across all S&E fields. In 1987, the overall average score for this group was 404, compared with 554 for whites. This difference of 150 points had decreased from 177 points in 1979. By S&E field, the largest gap in scores (204 points) was among those who majored in mathematical science, and the smallest gap (124 points) was among engineering majors.

### ***Bachelor's Degree Production***<sup>14</sup>

The number of bachelor's degrees in science and engineering awarded to blacks fell from 18,743 in 1979 to 18,405 in 1989. In 1989, blacks accounted for 5.5 percent of all S&E baccalaureate recipients; in 1979, they accounted for 5.8 percent (based on appendix B, table 41).

The overall decline in bachelor's degree production masks very different trends. Although the number of blacks earning degrees in the agricultural and biological sciences, social sciences, and psychology fell, the number earning degrees in computer science and engineering rose dramatically. The number of computer science degrees earned by blacks in 1989 (2,457) was 385 percent higher than the number earned in 1979 (507). The number of engineering degrees increased from 1,775 in 1979 to 3,154 in 1989. Despite these increases, however, approximately one-half of blacks earned their degrees in either the social sciences (34 percent) or psychology (15 percent) in 1989. Within engineering, the majority of blacks earned bachelor's degrees in electrical/electronics engineering (41 percent) or mechanical engineering (21 percent) (based on appendix B, table 71).

## **Graduate Education**

### ***Propensity to Attend Graduate School***<sup>15, 16</sup>

In 1990, the proportion of recent graduates with S&E training who attended graduate school varied little between blacks and whites. Among students who received S&E bachelor's degrees in 1988 or 1989, about one in five of both blacks (18 percent) and whites (19 percent) was enrolled in full-time graduate studies in 1990. About 10 percent of both blacks and whites were enrolled in graduate school part-time. Blacks with

degrees in science and those with degrees in engineering enrolled in graduate school at almost the same rates: for example, 19 percent of blacks with degrees in science and 17 percent of those with degrees in engineering were enrolled in graduate school full-time. For whites, the difference between fields is larger: 22 percent of those with degrees in science, versus 10 percent of those with degrees in engineering, were pursuing graduate study on a full-time basis.

The pattern is similar for recent S&E master's degree recipients. About 18 percent of blacks, and 21 percent of whites, were attending graduate school full-time in 1990.<sup>17</sup>

### ***Graduate Enrollment***<sup>18, 19</sup>

The number of blacks enrolled in graduate science and engineering programs was 17 percent higher in 1990 than in 1983.<sup>20</sup> In 1990, 4 percent (12,891 of 299,110) of all students enrolled in graduate studies in S&E fields were black; 81 percent (241,210) were white. (appendix B, table 46). In comparison, the enrollment of whites in S&E fields in 1990 was approximately 7 percent higher than in 1983 (226,010).

The field distributions of blacks and whites differ substantially. Blacks are more likely than whites to be enrolled in science, especially social science, programs. In 1990, about 86 percent of blacks were in graduate programs in science fields; about 46 percent of these students were in social science (based on appendix B, table 46). In contrast, 78 percent of whites were enrolled in science fields, and 27 percent of these were in social science. In 1990, 14 percent of black S&E graduate students were enrolled in engineering fields, compared with 22 percent of white students.

### ***Advanced Degree Production***

**Master's Degrees.**<sup>21</sup> Production of master's degrees in S&E fields declined for blacks after the late seventies. In 1979, blacks accounted for 4.0 percent (1,988) of the 50,201 master's degrees awarded to U.S. citizens and permanent residents; by 1989 the proportion had dropped to 3.2 percent (1,688 of 51,872 degrees awarded) (appendix B, table 51). Not only had the proportion of degrees awarded to blacks grown smaller, but the number of S&E degrees had decreased by 15 percent.

The field distribution of master's degrees was similar to that at the bachelor's level. Almost half of the degrees earned by blacks in 1989 were in social science (22.5 percent) or psychology (23.4 percent) (appendix B, table 51). However,

<sup>14</sup> Data on bachelor's degrees are for U.S. citizens and non-citizens in the United States on permanent visas.

<sup>15</sup> Data for this section are from the National Science Foundation's biennial Survey of Natural Science, Social Science, and Engineering Graduates. The most recently completed survey was for 1990.

<sup>16</sup> National Science Foundation, Survey of Natural Science, Social Science, and Engineering Graduates, unpublished tabulations, table 51.

<sup>17</sup> Survey of Natural Science, Social Science, and Engineering Graduates, unpublished tabulations, table 51.

<sup>18</sup> Data for this section are from the National Science Foundation's annual Survey of Graduate Students and Postdoctorates in Science and Engineering.

<sup>19</sup> Data on graduate enrollment by racial or ethnic group are for U.S. citizens only.

<sup>20</sup> 1983 is the earliest year for which comparable data for racial and ethnic groups are available.

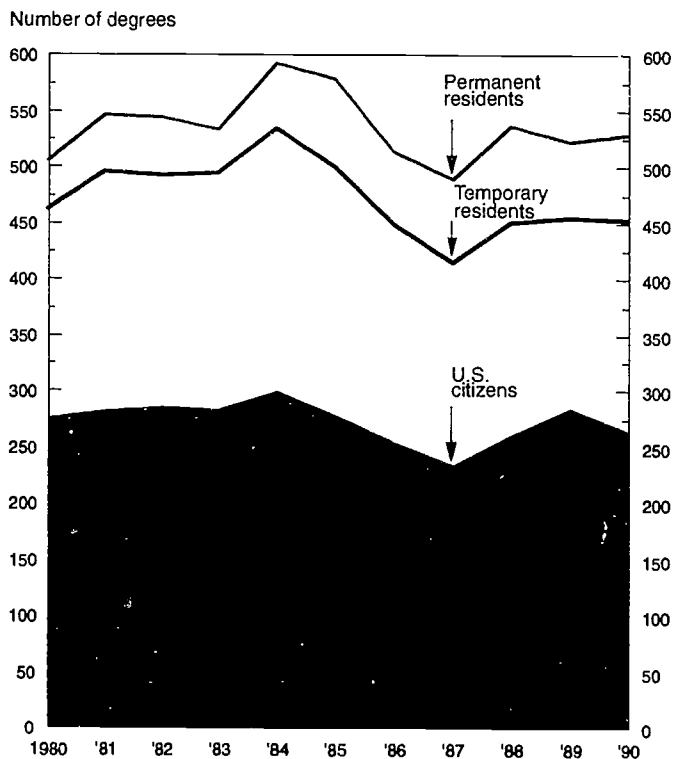

<sup>21</sup> Master's degree figures are for U.S. citizens and non-citizens in the United States on permanent visas.

the largest number of degrees (401 or 23.8 percent) was earned in engineering. Within engineering, blacks tended to earn degrees in electrical/electronics (29 percent), industrial (12 percent), and mechanical (11 percent) engineering (based on appendix B, table 71).

**Doctorates.** The 533 doctorates awarded to blacks in science and engineering in 1990 represent a 4.5-percent increase over the number awarded in 1980 (510) (based on appendix B, table 59). However, the actual average annual growth (calculated using 11 years of data) in the number of black Ph.D.'s over the decade was only 0.7 percent. This small increase is attributable to the growth in the number of blacks who were non-U.S. citizens on permanent visas; their number grew at an average annual rate of 8.3 percent (chart 4-4). While the number of blacks on permanent visas earning doctorates increased, the number of black doctoral students who were U.S. citizens declined annually at a rate of 0.2 percent. As a result, black U.S. citizens represented about half of black Ph.D. recipients in 1990; they had represented 54 percent a decade earlier. Blacks with permanent visas grew from 8.4 percent to 14.2 percent of total black Ph.D.'s. The number of temporary black residents grew at an annual rate of 0.5 percent over the decade, but the proportion declined from 36.5 percent to 35.3 percent of total black Ph.D.'s.

**Chart 4-4. Black S&E doctorate recipients, by citizenship: 1980-90**

SOURCE: Appendix B, tables 60-62

For black U.S. citizens, declines in doctoral study were most evident in psychology, mathematics, and social sciences. The number of degrees awarded to blacks in these three fields dropped from 202 in 1980 to 180 in 1990. The number of engineering doctorates received by blacks, however, increased from 11 to 28. In 1990, blacks constituted about 1.9 percent of new doctorates awarded to U.S. citizens; in 1980 they accounted for 2.0 percent (based on appendix B, table 60).

### Graduate Support Status

Sources of financial support reported by U.S. citizens who were recent S&E doctorate recipients differed somewhat between blacks and whites.<sup>22</sup> In 1990, of those reporting a primary source of financial support for their graduate work, fewer blacks than whites reported university support as their primary source. For U.S. citizens, primary support sources differed as follows (based on appendix B, table 63):

- University funding—42 percent (blacks) versus 55 percent (whites).
- Personal (own or family resources)—37 percent (blacks) versus 33 percent (whites).
- Federal funding—12 percent (blacks) versus 9 percent (whites).

Sources of support for 1990 Ph.D. recipients, regardless of citizenship status, were similar for blacks and whites, with one exception. Blacks were less likely to receive university funds than were whites (46 percent versus 56 percent).<sup>23</sup> About 30 percent of both blacks and whites cited personal funds as a primary source of support and 9 percent of blacks and 8 percent of whites had relied on Federal funds to finance their doctoral education.

### National Science Foundation Fellowships<sup>24</sup>

The National Science Foundation's (NSF's) Minority Graduate Fellowship Program began in fiscal year (FY) 1978 as an experimental mechanism designed to increase the number of scientists and engineers from those racial and ethnic minority groups traditionally underrepresented in the advanced levels of the Nation's S&E talent pool. In FY 1978 institutional selection was used as the nominating mechanism, and in FY 1979 the program was redesigned as a national competition to carry out the broadened concept of support of graduate study by minorities.

<sup>22</sup> Source of support is available by broad categories only, owing to a 22-percent nonresponse rate to this item on the 1990 Survey of Earned Doctorates. Survey response rates are included in Delores H. Thurgood and Joanne M. Weinman, Summary Report 1990: Doctorate Recipients from United States Universities, National Research Council, Office of Scientific and Engineering Personnel, National Academy Press, 1991, pp. 88-93.

<sup>23</sup> National Research Council, Office of Scientific and Engineering Personnel, Survey of Earned Doctorates, unpublished tabulations.

<sup>24</sup> Data for this section are from the NSF's Minority Graduate Fellowship Program, administered by the Division of Research Career Development in the Directorate for Science and Engineering Education. Minority data are collected only in the aggregate, and include both racial and ethnic minorities. Information presented here is from unpublished sources.

In FY 1990, the number of applicants to the Minority Fellowship Program was 869 (appendix B, table 69), up from 404 in FY 1980 (appendix B, table 67) and 612 in FY 1985 (appendix B, table 68). By field, about 46 percent of the applicants were in engineering, mathematics, or the physical sciences; 30 percent were in the behavioral and social sciences; and 24 percent were in the life and medical sciences. The engineering field had the highest number of applicants in FY 1990 (211), followed by social science (92).

Of the 869 applicants in FY 1990, about 35 percent were offered either new awards (150) or continuations (151) (appendix B, table 69). An additional 29 percent (253) received honorable mentions. In FY 1980, 31 percent of the 404 applicants received new (55) or continuing awards (72), and 32 percent (130) received honorable mentions.

### Postdoctoral Appointments

In 1989, blacks held 214 postdoctoral appointments in science and engineering, or 1.4 percent of the total; whites held 82 percent (12,046) of all such appointments (appendix B, table 70). The number of black postdoctoral appointments in 1989 was more than triple the number in 1979 (66).<sup>25</sup>

The vast majority of postdoctoral appointments for both blacks (88 percent) and whites (98 percent) in 1989 were in science fields. About 12 percent of blacks and 2 percent of whites held postdoctoral appointments in engineering in 1989. Within the sciences, 60 percent of black and 62 percent of white appointment holders were concentrated in the life sciences field.

## ASIANS

### Precollege Preparation<sup>26</sup>

#### Characteristics of College-Bound Seniors

College-bound seniors are those high school seniors who take the SAT. All students, including temporary residents of the United States, are eligible to take this exam. The SAT is used as a criterion in admissions decisions in many U.S. colleges and universities. In 1991, about 44 percent of the Asians who took the examination were not U.S. citizens: 29 percent were permanent residents and about 15 percent were on temporary visas.<sup>27</sup> In contrast, almost all of the whites who took the exam (98 percent) were U.S. citizens.

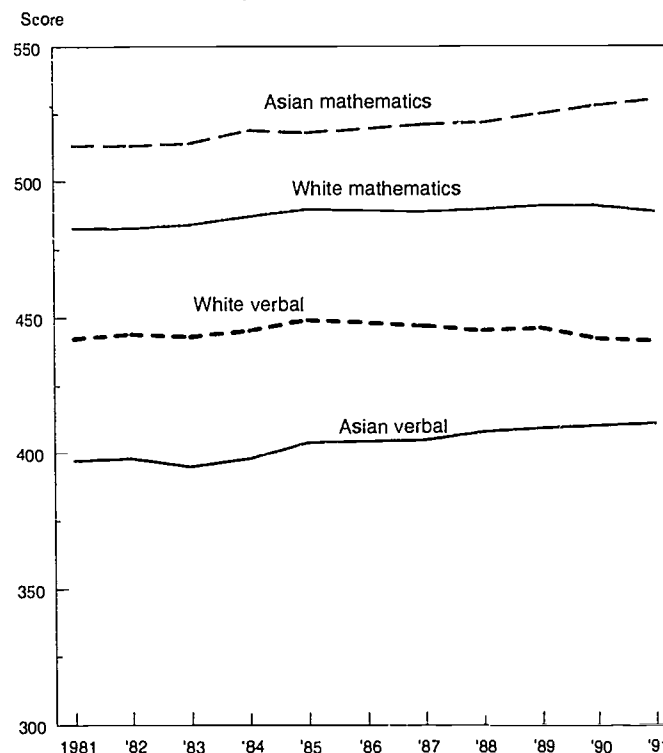

**Coursework.** Data on the types of mathematics and science coursework taken by college-bound high school seniors indicate that Asians are better prepared academically for the

SAT than are whites. In terms of mathematics coursework, 94 percent of both Asians and whites had taken geometry, but much higher proportions of Asians in 1991 had taken either trigonometry or calculus (appendix B, table 29). For example, twice as many Asians as whites had taken a calculus course (38 percent versus 19 percent). Asians were also more likely than whites to have taken honors math courses (37 percent versus 24 percent).

The same pattern is evident for science courses. Whereas almost all students had taken biology, Asians reported taking a chemistry or physics course more often than did whites. For instance, the proportions of Asian and white students who reported taking courses in physics were 64 percent and 44 percent, respectively, in 1991. A larger percentage of Asians reported having taken an honors science course; however, the percentage difference (32 percent versus 23 percent) was not as great as that for honors math courses.

**SAT Scores.** In 1991, Asians constituted about 7.4 percent (76,700) of the college-bound seniors who took the SAT.<sup>28</sup> About equal numbers of Asian males and females took this exam.

Chart 4-5. SAT scores for Asian and white college-bound seniors: 1981-91

NOTES: The score range is 200 to 800. Data are not available for 1986.

SOURCE: Appendix B, table 30

<sup>25</sup> National Science Foundation, *Characteristics of Doctoral Scientists and Engineers in the United States: 1979*. NSF 80-323, Survey of Science Resources Series, table B-4, p. 18.

<sup>26</sup> For explanations and definitions of the data sets and examinations used in this section, see chapter 2, "Education and Training of Women in Science and Engineering." Data on mathematics and science achievement from the National Assessment of Educational Progress are not collected separately for Asian students.

<sup>27</sup> College Bound Seniors, National Report, p. 6. Figures for Asians are from an unpublished report available from The College Board of the Educational Testing Service.

<sup>28</sup> College Bound Seniors, National Report, p. 6.

Between 1981 and 1991, scores for Asians on the verbal component of the SAT were lower than those for whites; their mathematics scores remained higher, however (chart 4-5). In 1991, Asians' verbal scores averaged 411, which was 30 points lower than the average for whites (441). In 1981, there was a 45-point difference between the scores of Asians (397) and whites (442). This narrowing of the gap is the result of a steady increase in Asian scores, accompanied by virtually no change in the scores of whites.

Asians score higher than whites on the mathematics component: this difference has increased over the decade. In 1991, the average score for Asians (530) was 41 points higher than that for whites (489); this differential was up from 30 points a decade earlier, when the average score was 513 for Asians and 483 for whites. The widening gap is attributable to the fact that scores for Asians increased more than did those for whites.

The proportion of college-bound seniors who scored above 650 on the verbal section of the SAT was 5 percent for Asians versus 3 percent for whites (appendix B, table 31). On the mathematics component, more than twice as many Asians as whites (22 percent versus 10 percent) scored in the top range (650 to 800).

**Achievement Test Scores.** Asians account for a slightly higher percentage of achievement-test-takers in science and mathematics than of all those who take achievement tests in any field. In 1991, about 19 percent of the students who had taken one or more science or math achievement tests were of Asian descent; 16 percent of the students who had taken an achievement test in at least one field were Asian.<sup>29</sup> The proportions of test-takers who were white were 61 percent of those who had taken science and mathematics achievement tests and 62 percent of those who had taken an achievement test in at least one field.

In 1991, Asians scored about the same as whites or slightly higher on science and mathematics tests. The largest differences in scores were on the mathematics level I and level II exams (appendix B, table 32). Differentials on these tests were 19 points and 15 points, respectively, in favor of Asians. The SAT mathematics scores for Asians who had taken science and mathematics achievement tests were higher than scores for whites who had taken these tests.

**Advanced Placement Examinations Scores.** Almost 13 percent of all advanced placement exams (61,862 of 480,696) were taken by Asians and 70 percent (338,863) were taken by whites.<sup>30</sup> However, over 18 percent of the advanced placement exams in science, mathematics, and computer science were taken by Asians and 68 percent were taken by whites.<sup>31</sup>

<sup>29</sup> 1991 Profile of SAT and Achievement Test Takers (Asian and White Profiles), 1991, p. 11.

<sup>30</sup> 1990 Advanced Placement Program, National Summary Reports, p. 3.

<sup>31</sup> 1990 Advanced Placement Program, National Summary Reports, p. 3. Science includes biology, chemistry, and physics.

With the exception of the computer science exams, Asians achieved higher scores than whites on all advanced placement exams (table 4-3). Asians scored roughly 3 (qualified) or above on the science and mathematics tests; whites tended to score in the upper 2 (possibly qualified) to 3 range.

**Table 4-3. Advanced placement scores for Asian and white test-takers: 1990**

Exam	Asian	White
Biology	3.17	2.97
Chemistry	3.20	2.93
Physics B	2.97	2.79
Physics C-mechanics	3.49	3.38
Physics C-electricity and magnetism	3.34	3.33
Mathematics/calculus AB	3.43	3.24
Mathematics/calculus BC	3.72	3.65
Computer science AB	2.74	2.08
Computer science A	2.94	3.00

SOURCE: Appendix B, table 33

**Intended Undergraduate Major.** Asian seniors are slightly more likely than white seniors to choose science and engineering fields as their intended undergraduate major (37 percent versus 34 percent; appendix B; table 34). They are also almost twice as likely to choose an engineering discipline. In 1991, about 17 percent of Asians and 10 percent of whites planned to major in engineering. Within the sciences, Asians plan to major in biology and computer science slightly more often than do whites.

SAT mathematics scores for Asians who intend to major in science or engineering are higher than those for the comparable population of whites (chart 4-6). The largest differential in 1991, 53 points, was for those who intended to major in biological science (scores were 571 for Asians versus 518 for whites).

## Undergraduate Education

### *Characteristics of American Freshmen*<sup>32</sup>

**Grade Point Average.** The self-reported high school grades of Asian freshmen were substantially higher than those of whites in 1990 (appendix B, table 35). Almost half (48 percent) of Asian freshmen said that their grade point averages were in the A range; the proportion for whites was 32 percent. Moreover, almost twice as many whites as Asians had averages of C or below: 11 percent versus 6 percent. In 1980, about 42 percent of Asian freshmen reported high school GPAs in the A range and 8 percent reported GPAs of C or below; these percentages for whites were 29 percent and 12 percent, respectively.

<sup>32</sup> Data by racial/ethnic group are for all freshmen and not just those whose intended major is science or engineering. All figures are from the American Freshman Norm Survey and are contained in table 35 in appendix B of this report.

**Chart 4-6. SAT mathematics scores of Asian and white college-bound seniors, by intended S&E major: 1991**

NOTE: The score range is 200 to 800.  
SOURCE: Appendix B, table 34

**Degree Aspirations.** In 1990, over 42 percent of Asian freshmen planned to obtain either a doctorate (23 percent) or a medical degree (20 percent). In comparison, 21 percent of whites planned to become Ph.D.'s (14 percent) or medical doctors (7 percent). A much lower proportion of Asians than of whites (14 percent versus 29 percent) indicated that their highest degree would be a baccalaureate.

**Level of Parents' Education.** Parents' education levels differ somewhat between Asian and white freshmen. More Asians than whites report that their mothers and fathers have less than a high school education. It is interesting that higher percentages of Asians also report that their parents have graduate degrees. For example, in 1990, 12 percent of Asian freshmen, compared with 7 percent of whites, said their fathers were not high school graduates; however, at the same time, almost 33 percent of Asians and 22 percent of whites indicated that their fathers held graduate degrees. For mother's education, 17 percent of Asians and 5 percent of whites reported less than high school; 17 percent of Asians and 12 percent of whites reported that their mothers had graduate degrees.

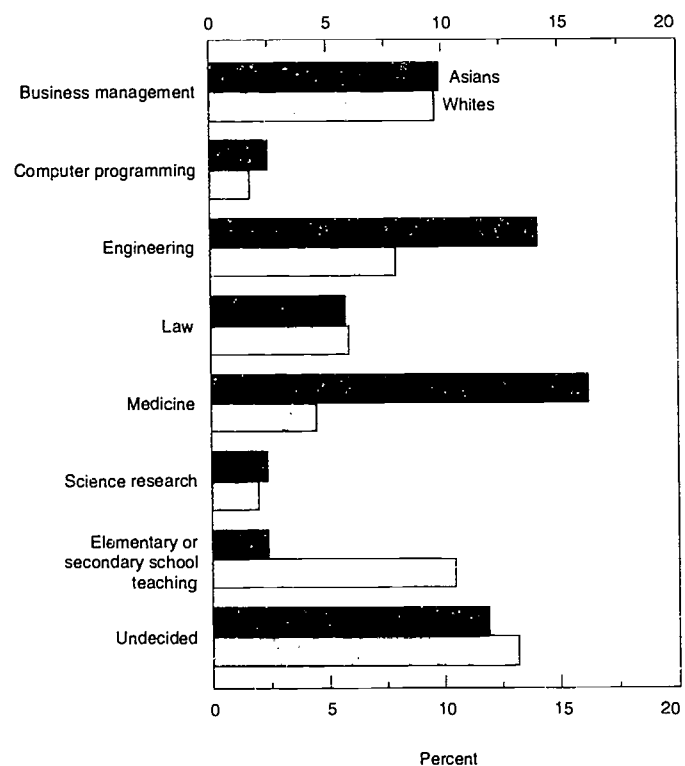

**Annual Parental Income.** Asian freshmen's estimates of their parents' income are somewhat lower than those of white

freshmen. In 1990, about 20 percent of Asians and 9 percent of whites reported household incomes of less than \$20,000. The percentage reporting income in excess of \$75,000 was 23 percent for both Asians and whites.

**Plans for Financial Aid.**<sup>33</sup> A majority of both Asian and white freshmen reported that they received financial assistance from parents and relatives and used their savings to finance their first year of college. In 1990, about 85 percent of both Asians and whites cited parents and relatives as one source of aid; 82 percent of Asians and 100 percent of whites listed savings. Approximately one-third (32 percent) of Asians stated they received either a Federal Guaranteed Student loan (21 percent) or a National Direct Student Loan (11 percent). Proportions for whites were 20 and 7 percent, respectively.

**Intended Career.** Coincident with their higher degree aspirations, 30 percent of Asian freshmen in 1990 planned to become either engineers (14 percent) or physicians (16 percent); the comparable figure for whites was about 13 percent (engineers, 8 percent; physicians, 5 percent) (chart 4-7). Among other careers, Asians chose elementary or secondary school teaching as their intended profession to a much lesser extent than did whites (2 percent versus 11 percent).

**Chart 4-7. Intended career choices of Asian and white freshmen, by selected occupation: 1990**

SOURCE: Appendix B, table 36

<sup>33</sup> Students were asked to select all sources of financial aid that applied; therefore, students may be included in more than one category.

## Graduate Record Examination<sup>34, 35</sup>

In 1987, about 4 percent of GRE test-takers who majored in science or engineering at the undergraduate level were Asian; among all test-takers, 3 percent were Asian. Asians generally scored lower than whites on the GRE verbal and analytical components, but higher on the quantitative section (table 4-4).

On the verbal component, the overall score of 476 for Asians in 1987 was 40 points lower than that for whites. Differences in scores for Asians and whites who majored in S&E fields varied dramatically. For example, the verbal scores of Asians who majored in mathematical science were 96 points lower than those of whites; for biological science majors, the gap was 16 points. Between 1979 and 1987, scores for Asians on this component rose more than did those for whites (appendix B, table 37).

**Table 4-4. GRE scores for Asian and white test-takers, by undergraduate major: 1987**

Component and field	Asians	Whites
<b>Verbal</b>		
Physical science	516	546
Mathematical science	441	537
Biological science	511	527
Behavioral science	504	528
Social science	460	488
Engineering	451	532
<b>Quantitative</b>		
Physical science	672	645
Mathematical science	658	673
Biological science	612	581
Behavioral science	547	522
Social science	517	495
Engineering	682	688
<b>Analytical</b>		
Physical science	583	608
Mathematical science	553	639
Biological science	564	582
Behavioral science	531	551
Social science	484	526
Engineering	554	626

NOTE: The score range is 200 to 800 for each component.  
SOURCE: Appendix B, table 37

Average scores on the quantitative section in 1987 were 63 points higher for Asians (604 versus 541), but this difference varies for different S&E majors. For instance, Asian biological science majors scored 31 points higher than whites, but Asian mathematics majors scored 15 points lower.

<sup>34</sup> Data are for U.S. citizens only. For an explanation of this examination series, see chapter 2, "Education and Training of Women in Science and Engineering."

<sup>35</sup> GRE data more recent than 1987 were unavailable in the format needed to update this report; therefore, this section is the same as in the 1990 report. Figures for S&E majors are from unpublished tabulations by the National Science Foundation, Division of Science Resources Studies.

The pattern of analytical scores for Asians and whites is similar to the pattern of verbal scores. Overall, Asians scored 537—17 points lower than whites—in 1987. For science and engineering graduates, though, there was wide variation in scores. Although there was only an 18-point difference for biological science majors (564 for Asians versus 582 for whites), an 86-point gap was evident for those who majored in math (553 and 639, respectively).

## Bachelor's Degree Production<sup>36</sup>

In 1989, Asians received 19,734 S&E degrees, or 6 percent of all S&E bachelor's degrees awarded (336,582). This number was almost triple (279 percent increase) the number awarded to Asians in 1979 (7,080) (appendix B, table 41). The largest increases were in computer science and engineering, which increased by 762 percent and 271 percent, respectively, over their 1979 levels. In 1989, approximately 35 percent (6,903) of S&E degrees granted to Asians were in engineering, 20 percent (3,901) were in the social sciences, 15 percent (2,907) were in biological sciences, and 11 percent (2,268) were in computer science.

Within the field of engineering, Asians tend to earn degrees in electrical and electronics engineering. In 1989-90, approximately 49 percent of all engineering degrees earned by Asians were in electrical and electronics engineering (based on appendix B, table 71). Over one-fourth were in mechanical (16 percent) or computer (10 percent) engineering.

## Graduate Education<sup>37</sup>

### Propensity to Attend Graduate School

Asian science and engineering degree recipients are much more likely to attend graduate school than are whites. In 1990, approximately 28 percent of Asian baccalaureate holders who had received their degrees in either 1988 or 1989 were in graduate school full-time and 10 percent were enrolled part-time.<sup>38</sup> Of whites, 19 percent attended full-time and 11 percent part-time. In the sciences and engineering, Asians enrolled in graduate school full-time at higher rates than did whites. For example, 33 percent of Asians with bachelor's degrees in science and 20 percent of those with degrees in engineering were enrolled in graduate school. Comparable figures for whites were 22 percent and 10 percent.

At the master's degree level, 35 percent of Asian S&E graduates were full-time graduate students in 1990. In contrast, about 21 percent of white S&E master's degree recipients were in school full-time.<sup>39</sup>

<sup>36</sup> Data on bachelor's degrees are for U.S. citizens and persons in the United States on permanent visas.

<sup>37</sup> Data on NSF minority fellowships cannot be disaggregated by racial or ethnic group. For a discussion of these awards for all minorities, however, see the section "National Science Foundation Fellowships" for blacks.

<sup>38</sup> Survey of Natural Science, Social Science, and Engineering Graduates, unpublished tabulations, table 51.

## Graduate Enrollment<sup>40</sup>

The number of Asians enrolled in graduate science and engineering programs in 1990 (17,474) was almost double the number in 1983<sup>41</sup> (9,393) (appendix B, table 46). In 1990, Asians represented 5.8 percent of total S&E graduate enrollment (9.5 percent of engineering and 4.7 of science). In 1983, Asians accounted for 3.4 percent of total S&E enrollment (5.3 percent of engineering and 2.8 percent of science). In 1990, 39 percent of Asians in S&E graduate programs were enrolled in engineering programs, 13 percent were in biological science programs, and 16 percent were in computer science programs.

## Advanced Degree Production

**Master's Degrees.**<sup>42</sup> In 1989, Asians represented about 6 percent of S&E master's degree recipients. The number of S&E master's degrees awarded to Asians increased from 1,895 in 1979 to 4,100 in 1989 (appendix B, table 51). Again, more than half of this growth was due to an increase in engineering degrees. The number of master's degrees in engineering awarded to Asians rose from 850 in 1979 to 2,027 in 1989, an increase of 138 percent. In comparison, the number of engineering degrees earned by whites (10,082 in 1979; 13,422 in 1989) increased by 33 percent over the same time period. In 1989, engineering degrees accounted for 49 percent of all master's degrees awarded to Asians. Within engineering, Asians tend to major in the same fields as at the bachelor's degree level—39 percent major in electrical or electronics engineering, 15 percent in computer engineering, and 12 percent in mechanical engineering (appendix B, table 71).

**Doctorates.** The number of doctorates earned by Asians in science and engineering has also shown a marked increase, rising from 2,118 in 1980 to 5,028 in 1990 (appendix B, table 59). Eighty percent of these degrees were earned by non-U.S. citizens on temporary visas, up from 57 percent in 1980 (chart 4-8). In 1990, about 22 percent of new doctorate recipients were Asian; a decade earlier, 12 percent had been Asian.

The number of S&E doctorates granted to U.S. citizens who were Asian also increased. In 1990, this group earned 467 doctorates (3.4 percent of all doctorates awarded to U.S. citizens), up from 325 (2.4 percent) 10 years earlier (appendix B, table 60). In 1990, 33 percent of these degree recipients were in engineering fields; 26 percent earned Ph.D.'s in agricultural/biological sciences and 18 percent in the physical sciences.

Chart 4-8. Asian S/E doctorate recipients, by citizenship: 1980-90

SOURCE: Appendix B, table 60-62

## Graduate Support Status

Asians who earned doctorates in science and engineering in 1990 reported primary sources of financial support that differed greatly from those of whites. For example, of the doctorates who reported a primary source of financial support, 79 percent of Asians reported that they were primarily supported by the university, compared with about 56 percent of whites.<sup>43</sup> Also, 11 percent of Asians used personal funds as the primary means of financing their doctoral education; 31 percent of whites did likewise. Federal support was a primary source of support for less than 2 percent of Asians and 8 percent of whites.

A different picture emerges for Asians, however, when only U.S. citizens who earned these degrees are considered. Among U.S. citizens who earned S&E doctorates in 1990, about 62 percent of Asians and 55 percent of whites received university assistance (based on appendix B, table 63). Of other types of support, 11 percent of Asians, compared with 9 percent of whites, were primarily supported by Federal sources. Asians (20 percent) were less likely than whites (33 percent) to use personal funds to finance their graduate education.

<sup>40</sup> Data are for U.S. citizens only.

<sup>41</sup> 1983 is the earliest year for which comparable data for racial and ethnic groups are available.

<sup>42</sup> Data on master's degrees are for U.S. citizens and non-citizens in the United States on permanent visas.

<sup>43</sup> National Research Council. Office of Scientific and Engineering Personnel. Survey of Earned Doctorates. unpublished tabulations.

## Postdoctoral Appointments

In 1989, Asians held 16 percent (2,352 of 14,760) of all S&E postdoctoral appointments; whites held 82 percent (12,046) of all such appointments (based on appendix B, table 70). Between 1979 and 1989, the number of Asians with these appointments rose by about 104 percent, compared with a 40-percent increase for whites.<sup>44</sup> By field in 1989, the highest proportions of both Asians (49 percent) and whites (62 percent) held postdoctoral appointments in the life sciences.

## NATIVE AMERICANS

### Precollege Preparation<sup>45</sup>

#### *Characteristics of College-Bound Seniors*

**Coursework.** Differences in mathematics and science course-taking behavior between Native American and white college-bound seniors are similar to those between blacks and whites. Although Native Americans and whites are equally likely to take introductory coursework, whites take advanced coursework to a much greater extent. In mathematics, the biggest differences arise in trigonometry and calculus. In 1991, for instance, 45 percent of Native Americans reported having taken a trigonometry course, whereas 56 percent of whites did so (appendix B, table 29). In science, Native Americans tend not to take chemistry and physics to the same extent as do whites. For example, 72 percent of Native Americans took chemistry and 33 percent physics. In comparison, 82 percent of whites took chemistry and 44 percent physics.

**Scholastic Aptitude Test Scores.** Native American representation among SAT test-takers was 0.7 percent (7,843 of 1,032,685) in 1991. About 47 percent of these students were male and 53 percent female.<sup>46</sup>

Native Americans' scores are lower than those of whites on both components of the SAT (chart 4-9). In 1991, the average verbal score was 393 for Native Americans; for whites, it was 441 (appendix B, table 30). Between 1981 and 1991, these scores rose by only 2 points for Native Americans and declined by 1 point for whites. Consequently, there is a 48-point difference between Native American and white scores in 1991, down from a 51-point difference in 1981.

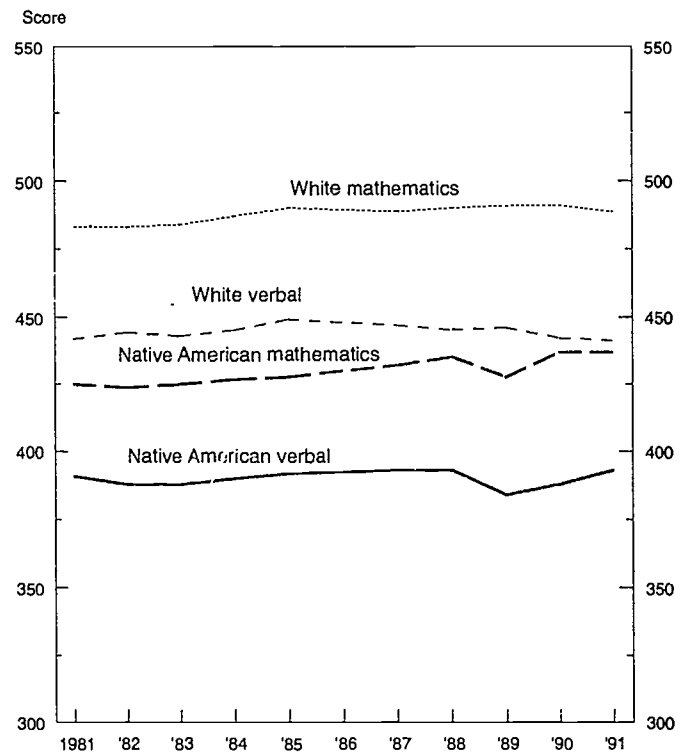

Native Americans have shown slightly more progress on the mathematics section. In 1991, their score of 437 was 52 points lower than that of whites (489); in 1981, this difference was 58 points—the average score was 425 for Native Americans, versus 483 for whites.

<sup>44</sup> Figures for 1979 are from *Characteristics of Doctoral Scientists and Engineers: 1979*, p. 18. There were 1,155 Asian/Pacific Islanders and 8,593 whites with postdoctorates in 1979.

<sup>45</sup> For explanations and definitions of the data sets and examinations used in this section, see chapter 2, "Education and Training of Women in Science and Engineering." Data for the mathematics and science assessments are not disaggregated for Native American students.

<sup>46</sup> *College Bound Seniors*, National Report, p. 6.

Chart 4-9. SAT scores of Native American and white college-bound seniors: 1981-91

NOTES: The score range is 200 to 800. Data are not available for 1986.

SOURCE: Appendix B, table 30

Native Americans are less likely than whites to score above 650 on either component. Only about 1 percent of Native Americans, compared with 3 percent of whites, scored in the 650 to 800 range on the verbal section in 1991 (appendix B, table 31). On the mathematics component, the proportions in the highest range were 3 percent (Native Americans) and 10 percent (whites).

**Achievement Test Scores.** Native Americans account for very few of either all achievement test-takers or those who take one or more tests in science and mathematics. In 1991, they constituted only about 0.4 percent of each group.<sup>47</sup>

Scores for Native Americans on all science and mathematics achievement tests were lower than those for whites; the gaps ranged from 31 points (mathematics level II) to 56 points (biology) (appendix B, table 32). Likewise, SAT mathematics scores for Native Americans who took these tests were lower than those of whites.

<sup>47</sup> *College Bound Seniors*, National Report, p. 11. Figures for Native Americans are from an unpublished report available from The College Board of the Educational Testing Service.

**Advanced Placement Examinations Scores.** In 1990, Native Americans took about 0.3 percent of all advanced placement tests (1,578 out of 480,696) and also 0.3 percent of the exams in science, mathematics, and computer science.<sup>48</sup> Grades on the science, mathematics, and computer science tests for Native Americans fell between 2 (possibly qualified) and 3 (qualified for college credit), except for physics C-electricity and magnetism, where the average score was 1.5 (table 4-5). The highest advanced placement grade for Native Americans in 1990, an average score of 3.52, was on the mathematics/calculus BC exam. Regardless of field, scores for Native Americans were below those for whites.

**Table 4-5. Advanced placement examination scores for Native American and white test-takers: 1990**

Exam	Native Americans	Whites
Biology	2.50	2.97
Chemistry	2.20	2.93
Physics B	2.04	2.79
Physics C-mechanics	2.13	3.38
Physics C-electricity and magnetism	1.50	3.33
Mathematics/calculus AB	2.51	3.24
Mathematics/calculus BC	3.52	3.65
Computer science AB	2.23	2.88
Computer science A	2.50	3.00

SOURCE: Appendix B, table 33

**Intended Undergraduate Major.** Roughly one of every four Native American (23 percent) and white (24 percent) seniors planned to major in a science field in 1991 (appendix B, table 34). Within science fields, both Native Americans (12 percent) and whites (13 percent) tended to choose the social sciences as a major. Also, Native Americans (9 percent) and whites (10 percent) indicated engineering as an intended major at about the same rate.

SAT mathematics scores for prospective science majors are lower for Native Americans than for whites (chart 4-10). In 1991, the largest gap (84 points) was among potential computer science majors; Native Americans scored 424, compared with 508 for whites.

As noted above, about the same percentage of Native Americans as whites intended to study engineering. The SAT mathematics scores for these students were 503 for Native Americans and 569 for whites, a 66-point difference.

**Chart 4-10. SAT mathematics scores of Native American and white college-bound seniors, by intended S&E major: 1991**

NOTE: The score range is 200 to 800.

SOURCE: Appendix B, table 34

## Undergraduate Education <sup>49</sup>

### Graduate Record Examination <sup>50</sup>

In 1987,<sup>51</sup> Native American representation among GRE test-takers was 0.6 percent. This proportion was about the same as the proportion that had majored in either science or engineering at the undergraduate level. Native Americans scored lower than whites on all components of the GRE (table 4-6). These differences were generally not as large on the quantitative and analytical components for those who majored in science and engineering.

On the verbal component, Native Americans' scores averaged 471 overall in 1987, compared with 516 for whites. For test-takers who had studied science and engineering, the differences between scores ranged from 25 points (physical science) to 48 points (biological science).

<sup>49</sup> Data are not disaggregated for Native Americans in the American Freshmen Norm Survey.

<sup>50</sup> For an explanation of this examination series, see chapter 2, "Education and Training of Women in Science and Engineering."

<sup>48</sup> 1990 Advanced Placement Program, National Summary Reports, p. 3. Science includes biology, chemistry, and physics.

**Table 4-6. GRE scores for Native American and white test-takers, by undergraduate major: 1987**

Component and field	Native Americans	Whites
<b>Verbal</b>		
Physical science	521	546
Mathematical science	500	537
Biological science	479	527
Behavioral science	487	528
Social science	447	488
Engineering	487	532
<b>Quantitative</b>		
Physical science	602	645
Mathematical science	652	673
Biological science	521	581
Behavioral science	459	522
Social science	439	495
Engineering	636	688
<b>Analytical</b>		
Physical science	574	608
Mathematical science	615	639
Biological science	510	582
Behavioral science	490	551
Social science	457	526
Engineering	563	626

NOTE: The score range is 200 to 800 for each component.  
SOURCE: Appendix B, table 37

Native Americans' scores on the quantitative section were almost 70 points lower than whites' scores in 1987 (473 versus 541). By S&E field, however, these differences tended not to be as large. For example, Native American and white engineering graduates had scores of 636 and 688, respectively.<sup>52</sup>

The pattern of analytical scores roughly duplicated that of quantitative scores. Although the score for Native Americans overall—487—was 67 points lower than that for whites, differences were generally not as large for S&E majors.

### **Bachelor's Degree Production**<sup>53</sup>

In 1989, S&E baccalaureates were granted to 1,323 Native Americans. These degrees accounted for only about 0.4 percent of the total, but represented an 11-percent increase over the number of Native Americans receiving baccalaureates in 1979 (1,187; appendix B, table 41). However, the number of Native Americans as a proportion of bachelor's degree recipients had not changed; in 1979 they also earned 0.4 percent of the degrees.

<sup>51</sup> GRE data more recent than 1987 were unavailable in the format needed to update this report; therefore, this section is the same as in the 1990 report. Figures for S&E majors are from unpublished tabulations by the National Science Foundation, Division of Science Resources Studies.

<sup>52</sup> Scores by S&E fields are from unpublished tabulations.

<sup>53</sup> Data on bachelor's degrees are for U.S. citizens and persons in the United States on permanent visas.

## **Graduate Education**<sup>54</sup>

### **Graduate Enrollment**

About 1,050 Native Americans were graduate students in science and engineering programs in 1990 (appendix B, table 46); they constituted about 0.4 percent of the total number of such students. Enrollment in social science (33 percent) and psychology (23 percent) programs accounted for over one-half of these students. Of white graduate students, about 21 percent were in social science and 16 percent were in psychology.

### **Advanced Degree Production**

**Master's Degrees.**<sup>55</sup> Native Americans also represented about 0.4 percent (205 of 51,872) of the S&E degree recipients at the master's level in 1989 (appendix B, table 51). Almost 41 percent of these degrees were in the social sciences (25 percent) or psychology (16 percent); 17 percent were in engineering.

**Doctorates.** Forty doctorates in science and engineering were granted to Native Americans in 1990, up from 27 a decade earlier (appendix B, table 59). This number was roughly 0.2 percent of all S&E doctorates awarded in 1990.

### **Graduate Support Status**

Native Americans who received their doctorates in science and engineering in 1990 reported personal finances as the primary source of financial support for their studies. For example, of the 33 Native Americans who reported a primary source of support for their graduate work, 15 cited their own or their family's resources as their primary funding source (appendix B, table 63). The remaining 18 reported they were supported by university funds (10), and received Federal support (5 percent), or support from other sources (3).

### **Postdoctoral Appointments**

The number of Native American postdoctoral appointees in science and engineering was 34 (appendix B, table 70). Almost all of these were either in the life sciences (22) or social sciences (7). About 0.2 percent of all S&E postdoctoral appointments were held by Native Americans in 1989, up from 0.1 percent in 1979, when 15 Native Americans held such appointments.<sup>56</sup>

<sup>54</sup> Data on NSF minority fellowships cannot be disaggregated by racial or ethnic group. For the discussion of these awards for all minorities, however, see the section "National Science Foundation Fellowships" for blacks.

<sup>55</sup> Data on master's degrees are for U.S. citizens and those in the United States on permanent visas.

<sup>56</sup> Characteristics of Doctoral Scientists and Engineers: 1979, p. 18.

## HISPANICS<sup>57</sup>

### Precollege Preparation<sup>58</sup>

#### *Mathematics and Science Achievement*

**Mathematics.**<sup>59</sup> Performance on this assessment did not change considerably for Hispanics in the last several years, with the exception of 13-year-olds. Regardless of age level, however, overall mean scores were lower for Hispanics than for all students.

*Nine-year-olds.* The mean score for Hispanic 9-year-olds in 1990 was 213.8, about 16 points lower than that for all students (229.6). These scores represent increases from 1973 scores of 11.7 points for Hispanics (202.1) and 10.5 points for all students (219.1).

The first major difference in levels of proficiency between Hispanics and all students shows up at level 200 (beginning skills and understanding). Only 68 percent of Hispanics scored at or above this mark, whereas 82 percent of all students did so.

*Thirteen-year-olds.* The greatest progress made by Hispanics in closing the score gap is at this age level. In 1990, Hispanics' mean score of 254.6 was a little less than 16 points lower than the overall average of 270.4. In 1973, the score differential was 27 points (238.8 for Hispanics versus 266.0 for all students).

Differences in proficiency become very noticeable at level 250 (basic operations and problem solving). About 57 percent of Hispanics, compared with 75 percent of all students, scored at or above level 250. At the 300 level (moderately complex procedures and reasoning), the percentages were 6 and 17, respectively.

*Seventeen-year-olds.* There was a 21-point difference between the mean scores of Hispanics (283.5) and the overall average (304.6) in 1990. This gap had been somewhat reduced—in 1973, when Hispanics had a mean score of 277.2 and the overall average was 304.4, the difference was 27 points.

One of the largest differences in proficiency between Hispanics and all students was exhibited at level 300 (moderately complex procedures and reasoning). Thirty percent of Hispanics and 56 percent of all students scored over this level.

**Science.**<sup>60</sup> Progress made by Hispanics on the science assessment was at the 9- and 13-year-old levels. For each age group, Hispanics' scores were lower than the national average. For example, they were 22 points lower for 9-year-olds, 24 points lower for 13-year-olds, and 29 points lower for 17-year-olds.

<sup>57</sup> Data for Hispanics are collected in several ways. Wherever possible, this section distinguishes between different Hispanic groups.

<sup>58</sup> For explanations and definitions of the data sets and examinations used in this section, see chapter 2, "Education and Training of Women in Science and Engineering."

<sup>59</sup> All data on mathematics assessment scores are taken from table 27 in appendix B of this report.

<sup>60</sup> All figures on science assessment scores are based on table 28 in appendix B of this report.

*Nine-year-olds.* Hispanics had an overall mean score of 206.2 in 1990; the average for all students was 228.7. This 27-point gap represents an improvement in the difference between Hispanic scores and scores for all students. In 1977, when Hispanic scores were 191.9 and all students averaged 219.9, the gap was 28 points.

Differences in proficiency show up at all levels. The 150 level (everyday facts) was reached by 94 percent of Hispanics, but by 97 percent of all students. By level 200 (simple principles), the proportions were 56 percent and 76 percent, respectively.

*Thirteen-year-olds.* There was a 24-point gap between the average score of Hispanics and the overall average at this age in 1990 (231.6 versus 255.2). This gap has narrowed considerably (down from 34 points) since 1977, when Hispanics averaged 213.4 and the average for all students was 247.4.

Despite this rise in scores, there is still wide variation in levels of proficiency for Hispanics. Whereas about 80 percent of Hispanics scored at or above level 200 (simple principles), 92 percent of all students did so. About 30 percent of Hispanics, compared with 57 percent of the total, scored at or above level 250 (application of basic information).

*Seventeen-year-olds.* The point differential between Hispanic scores and total scores was higher at this age than at the 9- and 13-year-old levels. In 1990, the difference was 29 points; 2 points higher than the 1977 gap of 27 points.

Hispanics score at lower proficiency levels than all students; the largest differences occur at the upper levels. For example, whereas 21 percent of Hispanics scored over 300 (ability to analyze procedures and data), the percentage for all students was 43. Likewise, 2 percent of Hispanics, compared with almost 9 percent of all students, scored above the highest level (350—integration of specialized knowledge).

#### *Characteristics of College-Bound Seniors*

**Coursework.** Mexican American college-bound seniors do not take advanced level mathematics and science courses to the same extent as do all seniors. Coursework for Puerto Ricans and Latin Americans, however, is similar to that for all college-bound students.

For mathematics coursework, differences are most notable in the proportions who take a trigonometry course. In 1991, for example, 55 percent of all seniors reported coursework in this subject (appendix B, table 29). Among Hispanics, 44 percent of Mexican Americans, but 51 percent of Puerto Ricans and 53 percent of Latin Americans, had taken trigonometry.

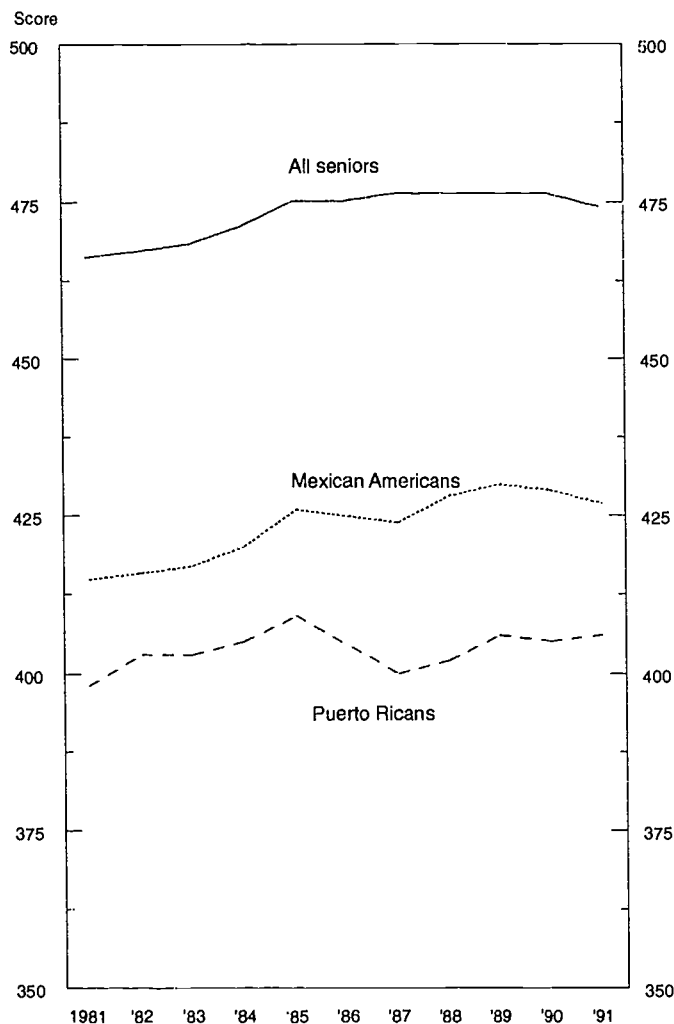

In science, the largest difference is in physics. Forty-four percent of all college-bound seniors took physics in high school, as did the same proportions of Puerto Ricans (42 percent) and Latin Americans (43 percent). Only 34 percent of Mexican Americans, however, had taken a physics course. Within the social sciences, a much larger proportion of Mexican Americans took economics (75 percent) than did all

students (52 percent), Puerto Ricans (39 percent) and Latin Americans (57 percent).

**Scholastic Aptitude Test Scores.** The representation of Hispanics among college-bound seniors in 1991 shows that about 2.8 percent (28,602 of 1,032,685) of the test-takers were Mexican American, 2.5 percent (25,584) were Latin American, and 1.2 percent (12,065) were Puerto Rican.<sup>61</sup> In all three groups, slightly more than one-half were female.

Hispanics continue to score below the national average on both components of the SAT, although they have made gains over the last 10 years (chart 4-11). Among Hispanics, scores have increased more for Mexican Americans than for Puerto Ricans on the mathematics section.<sup>62</sup>

**Chart 4-11. SAT mathematics scores of Hispanic and all college-bound seniors: 1981-91**

NOTE: The score range is 200 to 800. Data are not available for 1986.  
SOURCE: Appendix B, table 30

<sup>61</sup> College Bound Seniors, National Report, p. 6.

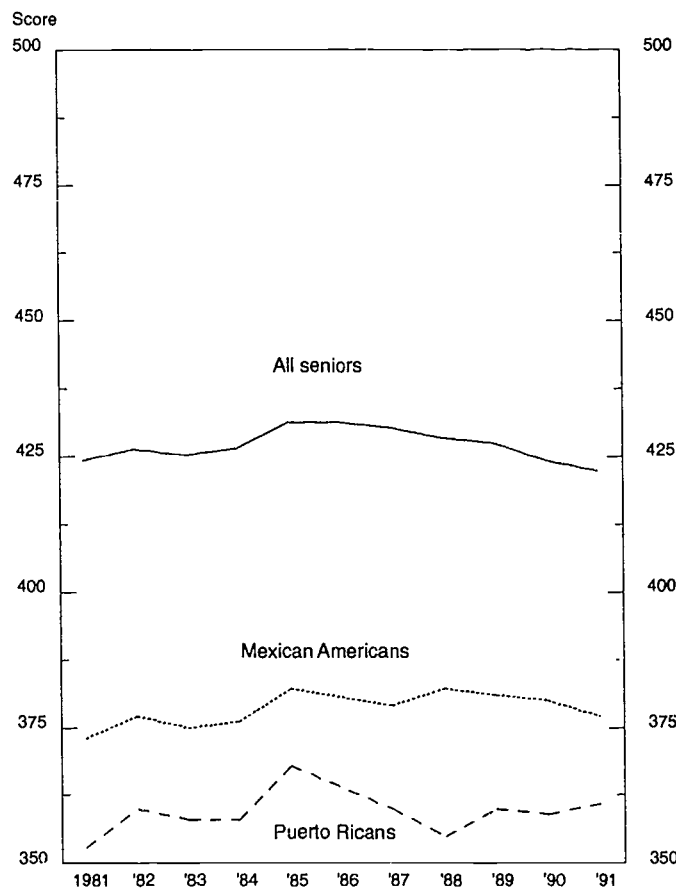

<sup>62</sup> Data on Hispanics have been available for Latin Americans, Mexican Americans, and Puerto Ricans since 1987. Prior to that time, data were not collected for Latin Americans.

Scores for Hispanics on the verbal component in 1991 were as follows:

- Latin Americans—382 (40 points below the average of 422 for all college-bound seniors).
- Mexican Americans—377 (45 points below the average, down from 51 points lower in 1981).
- Puerto Ricans—361 (61 points below the average, down from 71 points below the average in 1981).

One factor contributing to lower scores of Hispanics may be a language barrier. In 1991, for example, 8 percent of all seniors reported that English was not their first language; 45 percent of Latin American seniors, 35 percent of Puerto Rican seniors, and 22 percent of Mexican Americans reported that English was not the first language they had learned.<sup>63</sup>

**Chart 4-11a. SAT verbal scores of Hispanic and all college-bound seniors: 1981-91**

NOTE: The score range is 200 to 800. Data are not available for 1986.  
SOURCE: Appendix B, table 30

<sup>63</sup> College Bound Seniors, National Report, p. 6.

On the mathematics component, Hispanics also scored lower than average; Latin American and Mexican American scores were somewhat higher than those of Puerto Ricans. In 1991, scores for Hispanics were as follows:

- Latin Americans—431 (43 points below the average of 474 points for all college-bound seniors).
- Mexican Americans—427 (47 points lower, down from a differential of 51 points in 1981).
- Puerto Ricans—406 (68 points lower, compared with 68 points lower in 1981).

One percent of Latin Americans, Mexican Americans, and Puerto Ricans scored in the 650 to 800 range on the verbal test in 1991; 3 percent of all college-bound seniors did so (appendix B, table 31). On the mathematics component, the percentages of Latin Americans (4 percent) and Mexican Americans (3 percent) and Puerto Ricans (2 percent) who scored in this range were again much lower than the percentage of all students who did so (9 percent).

**Achievement Test Scores.** Slightly more than 5 percent of the college-bound seniors who took one or more science and mathematics achievement tests in 1991 were of Hispanic descent.<sup>64</sup> This proportion is similar to their share of all achievement test-takers (6 percent).<sup>65</sup>

Hispanic college-bound seniors scored lower than did all seniors on the five achievement tests administered in science and mathematics. Unlike the pattern exhibited in scores on the SAT, however, Mexican Americans have the lowest scores among Hispanics, except in chemistry. In 1991, the highest achievement test grade for all Hispanics was on the mathematics level II test. Latin Americans scored an average of 631 and had an SAT math score of 608; Puerto Ricans received a score of 627 on the achievement test and had an SAT mathematics score of 610; and Mexican Americans obtained a score of 599 on the achievement test and an SAT mathematics score of 574. In comparison, all achievement test-takers averaged 666 on the math level II test and had an average SAT math score of 654.

**Advanced Placement Examination Scores.** About 6 percent (27,377 of 480,696) of all advanced placement exams in 1990 were taken by Hispanics. Of these, 11,585 (42 percent) were taken by Mexican Americans, 2,499 (9 percent) by Puerto Ricans, and 13,293 (49 percent) by "other Hispanics."<sup>66</sup> A larger fraction of all advanced placement tests were taken by Hispanics (5.7 percent) than were exams in science, mathematics, and computer science (3.5 percent).<sup>67</sup>

<sup>64</sup> College Bound Seniors, National Report, p. 11. Figures for Mexican Americans, Latin Americans, and Puerto Ricans are from unpublished reports prepared for each group. These reports are available from The College Board of the Educational Testing Service.

<sup>65</sup> College Bound Seniors, National Report, p. 1. See footnote 64 for source of figures for different Hispanic groups.

<sup>66</sup> 1990 Advanced Placement Program, National Summary Reports, p. 3.

<sup>67</sup> 1990 Advanced Placement Program, National Summary Reports, p. 3. Science includes biology, chemistry, and physics.

Although Hispanics received lower scores than all test-takers on science, mathematics, and computer science tests, there was considerable variation by Hispanic subgroup (table 4-7). For example, in 1990, the score ranges were as follows:

- Mexican Americans—1.94 (computer science A) to 3.18 (mathematics/calculus AB).
- Puerto Ricans—2.05 (computer science AB) to 3.20 (mathematics/calculus BC).
- Other—2.06 (computer science AB) to 3.43 (mathematics/calculus AB).

**Table 4-7. Advanced placement examination scores for Hispanic and all test-takers: 1990**

Exam	Hispanic test-takers			
	All test-takers	Mexican American	Puerto Rican	Other Hispanic
Biology	2.96	2.20	2.41	2.47
Chemistry	2.94	2.10	2.49	2.34
Physics B	2.80	2.13	2.42	2.23
Physics C-mechanics	3.36	2.45	2.82	2.79
Physics C-electricity and magnetism	3.32	2.65	2.42	2.97
Mathematics/calculus AB	3.23	2.72	2.79	2.88
Mathematics/calculus BC	3.65	3.18	3.20	3.43
Computer science AB	2.81	2.25	2.05	2.06
Computer science A	2.92	1.94	2.07	2.24

SOURCE: Appendix B, table 33

**Intended Undergraduate Major.** About the same proportion of Hispanics as of all college-bound seniors intend to major in either a science field or engineering. In 1991, similar percentages of Latin Americans (24 percent), Mexican Americans (23 percent), and Puerto Ricans (23 percent) planned to major in a science field (appendix B, table 34). An additional 12 percent of each group chose engineering. Among Hispanics who planned an undergraduate S&E major, the highest SAT mathematics scores were for prospective mathematics majors (chart 4-12). Scores for this group were 550 for Latin Americans, 547 for Puerto Ricans, and 530 for Mexican Americans. The highest national SAT mathematics scores (605) were held by those planning to major in mathematics also.

## Undergraduate Education

### Characteristics of American Freshmen<sup>68</sup>

In 1990, of the freshmen who identified themselves as Hispanic, 75 percent were Mexican American or Chicano and 25 percent were Puerto Rican.

<sup>68</sup> Data are from unpublished tabulations from the American Freshman Norm Survey. See table 35 in appendix B of this report for figures used in this section, except for information on plans for financial aid.

**Chart 4-12. SAT mathematics scores of Hispanic and all college-bound seniors, by intended S&E major: 1991**

NOTE: The score range is 200 to 800  
SOURCE: Appendix B, table 34

**Grade Point Average.** Self-reported GPAs for Hispanics are very similar to those for all freshmen. Twenty-eight percent of Hispanics reported averages in the A range in 1990; about 24 percent of all freshmen did so. There was also little difference at lower levels: 14 percent of Hispanics and 17 percent of all freshmen reported having an average of C or below.

**Degree Aspirations.** Hispanic freshmen tended to aspire to higher levels of education than did all freshmen. For example, 18 percent planned to study for a doctorate and 10 percent were planning to obtain a medical degree. For all freshmen, these proportions were 14 percent and 6 percent, respectively. Moreover, 23 percent of Hispanics and 30 percent of all freshmen reported a baccalaureate as their highest planned degree.

**Level of Parents' Education.** Substantial differences exist in the level of parents' education reported by Hispanics and by all freshmen. For example, about 34 percent of Hispanic freshmen's fathers, compared with 10 percent for all freshmen, had less than a high school education. In contrast, the percentages of fathers who had college degrees were 14 percent (Hispanics) and 24 percent (all freshmen). Thirty-one percent of Hispanics and 8 percent of all freshmen indicated that their mothers did not have a high school diploma. The percentage of mothers who had college degrees was 13 percent and 23 percent, respectively for Hispanics and all freshmen.

**Annual Parental Income.** Estimated parental income is lower for Hispanics than for all freshmen. In 1990, approximately 31 percent of Hispanic freshmen reported an annual parental income of less than \$20,000; only 16 percent of all freshmen reported income at that level. At the higher income levels—\$75,000 and above—the proportions were 9 percent for Hispanics and 17 percent for all freshmen.

**Plans for Financial Aid.** Hispanic freshmen, in 1990, were less likely to rely on relatives (74 percent) or savings (75 percent) to finance their schooling than were all students (80 percent and 85 percent, respectively). Hispanics also received aid from grants and loans more often than did whites. For example, Pell Grants and Supplementary Education Opportunity Grants were cited by 56 percent of Hispanics as a source of financial aid, and by 30 percent of whites. Federal loan programs were used by 45 percent of Hispanics and 30 percent of whites.

**Intended Career.** Hispanic freshmen choose engineering (11 percent), law (8 percent), and medicine (8 percent) as their intended career fields more often than do all freshmen (7 percent, 5 percent, and 4 percent, respectively) (chart 4-13). Hispanics were not as likely to plan a career in elementary or secondary teaching as were all freshmen (8 percent versus 12 percent).

**Chart 4-13. Intended career choices of Hispanic and all freshmen, by selected occupation: 1990**

SOURCE: Appendix B, table 36

## Graduate Record Examination<sup>69, 70</sup>

In 1987, about 3.3 percent (5,789) of GRE test-takers were Hispanic, up from 2.8 percent in 1979. Specifically, 1.3 percent (2,226) were Mexican American, 1.1 percent (1,902) were Latin American, and 0.9 percent (1,661) were Puerto Rican. The representation of Hispanic GRE test-takers who majored in an S&E field at the undergraduate level was a little higher than their representation among all GRE test-takers—3.6 percent.

Although Hispanic test-takers who majored in S&E fields scored lower than did all S&E test-takers on the three GRE components, there was wide variation among ethnic subgroups. Scores for Latin Americans were generally higher than those for Mexican Americans or Puerto Ricans, regardless of component (table 4-8). On the verbal component, for example, scores in 1987 were as follows:

- Latin Americans—469, 18 points lower than the overall average.
- Mexican Americans—440, 47 points lower than the overall average.
- Puerto Ricans—380, 98 points lower than the overall average.

**Table 4-8. GRE scores for Hispanic and all test-takers, by undergraduate major: 1987**

Component and field	Hispanic test-takers			
	All test-takers	Mexican American	Puerto Rican	Latin American
<b>Verbal</b>				
Physical science	505	490	391	496
Mathematical science	483	472	414	468
Biological science	504	471	380	494
Behavioral science	507	458	401	482
Social science	458	421	361	446
Engineering	466	460	401	477
<b>Quantitative</b>				
Physical science	639	584	517	615
Mathematical science	657	613	573	603
Biological science	570	517	456	542
Behavioral science	513	446	403	479
Social science	479	405	378	436
Engineering	673	626	601	634
<b>Analytical</b>				
Physical science	572	529	437	542
Mathematical science	588	546	491	546
Biological science	557	504	426	528
Behavioral science	530	469	418	500
Social science	494	431	393	458
Engineering	563	539	491	542

NOTE: The score range is 200 to 800 for each component.  
SOURCE: Appendix B, table 37

<sup>69</sup> Data are for U.S. citizens only. For an explanation of this examination series, see chapter 2, "Education and Training of Women in Science and Engineering."

<sup>70</sup> GRE data more recent than 1987 were unavailable in the format needed to update this report; therefore, this section is the same as in the 1990 report. Figures for S&E majors are from unpublished tabulations by the National Science Foundation, Division of Science Resources Studies.

Score differences were greatest on the analytical section; scores ranged from 421 for Puerto Ricans (107 points lower than the score for all test-takers) to 493 for Latin Americans (35 points lower). All Hispanics who majored in physical science, mathematical science, or engineering fields received higher scores on the GRE than did social science or life science majors.

## Bachelor's Degree Production<sup>71</sup>

The number of S&E baccalaureates awarded to Hispanics has risen steadily in the past several years. In 1989, Hispanics earned 13,860 S&E baccalaureates, representing about 4 percent of the total number of S&E bachelor's degrees awarded to U.S. citizens (based on appendix B, table 41). Ten years earlier, Hispanics had represented 3.2 percent (10,333) of the total. Fields showing the largest increase from 1979 to 1989 were computer science (207 to 1,195), psychology (1,737 to 4,028), and engineering (1,555 to 3,168). Within engineering, over half of Hispanics earned baccalaureates in electrical or electronics engineering (34 percent) or mechanical engineering (21 percent) (based on appendix B, table 71).

## Graduate Education<sup>72</sup>

### Propensity to Attend Graduate School

Hispanics who had received their bachelor's degrees in science and engineering in 1988 or 1989 were just as likely as all students (roughly 20 percent) to be enrolled in graduate school full-time in 1990. At the master's degree level, however, a lower proportion of Hispanics than of all students pursued graduate studies on a full-time basis (20 percent versus 22 percent).<sup>73</sup>

### Graduate Enrollment<sup>74</sup>

Hispanics constituted 3.5 percent (10,502 of 299,110) of graduate enrollment in S&E fields in 1990; they constituted 3.2 percent (8,928 of 278,994) in 1983 (appendix B, table 46). This proportional increase was the result of an 18-percent growth rate in the number of Hispanics enrolled in S&E programs between 1983 and 1990. In comparison, overall graduate enrollment was 7.2 percent higher in 1990 than in 1983.

Hispanics were more likely (81 percent) than all graduate students (76 percent) to be in science rather than engineering programs. By field, Hispanics were more often in social science (29 percent) and psychology (21 percent) than were all students (21 percent and 16 percent, respectively).

<sup>71</sup> Data on bachelor's degrees are for U.S. citizens and persons in the United States on permanent visas.

<sup>72</sup> Data on NSF minority fellowships cannot be disaggregated by racial or ethnic group. For the discussion of these awards for all minorities, however, see the section "National Science Foundation Fellowships" for blacks.

<sup>73</sup> National Science Foundation, Survey of Natural Science, Social Science, and Engineering Graduates, unpublished tabulations, table 51.

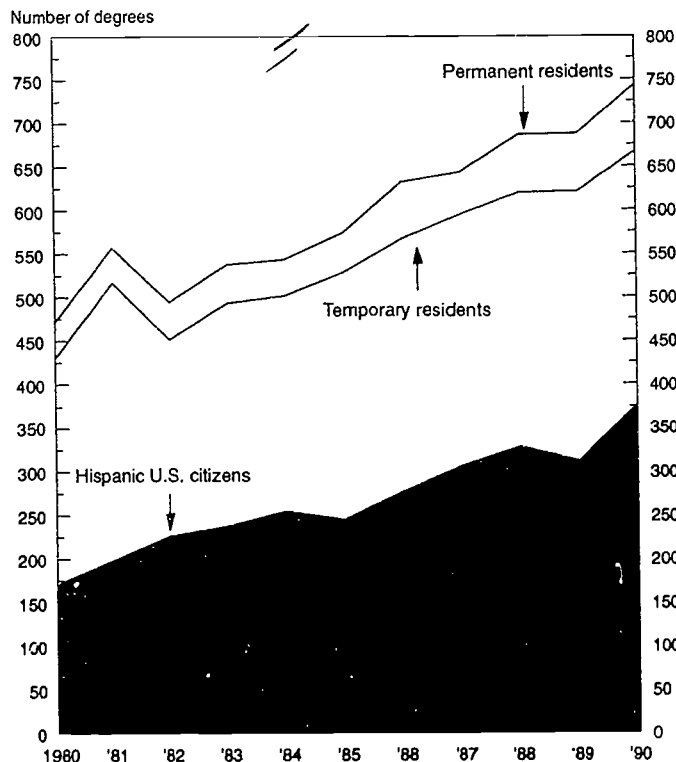

<sup>74</sup> Data are for U.S. citizens only.

## Advanced Degree Production

**Master's Degrees.**<sup>75</sup> In 1989, the number of master's degrees awarded to Hispanics (1,563) had increased by 61 percent over their 1979 level (970). As a result, Hispanics' share of all S&E master's degrees rose from about 2 percent to 3 percent (based on appendix B, table 51). The field distribution of these degrees shows that more than half of these Hispanics graduated in either engineering (31 percent) or psychology (23 percent). Within engineering, the majority of Hispanics majored in four fields—electrical or electronics, mechanical, industrial, and civil engineering (appendix B, table 71).

**Doctorates.** Of doctorates awarded in science and engineering in 1990, 3.3 percent (746 of 22,673) were granted to Hispanics, up from 2.7 percent (479 of 17,523) 10 years earlier (appendix B, table 59). Unlike the trend for blacks and Asians, however, the increase largely resulted from higher numbers of Hispanic U.S. citizens earning degrees in these fields (chart 4-14). Over the decade, this number more than doubled, from 171 to 376, and in 1990 U.S. citizens accounted for half of the doctorates awarded to Hispanics.

**Chart 4-14. Hispanic S&E doctorate recipients, by citizenship: 1980-90**

SOURCE: Appendix B, tables 60-62

<sup>75</sup> Data on master's degrees are for U.S. citizens and those in the United States on permanent visas.

Hispanic U.S. citizens showed growth in many fields. The number of Hispanics earning doctorates in the physical sciences rose from 20 in 1980 to 61 in 1990; the number in agricultural and biological sciences, from 30 to 86; the number in psychology, from 51 to 94; and the number in social sciences, from 45 to 74 (appendix B, table 60). Degrees granted to Hispanics in engineering also more than doubled, from 18 in 1980 to 39 in 1990.

## Graduate Support Status

Hispanics who earned doctorates in science and engineering in 1990 showed a distribution of primary sources of assistance that was slightly different from that of all doctorate recipients. For example, 53 percent of Hispanics—compared with 60 percent of all students—indicated that universities provided their major source of aid. Twenty-three percent of Hispanics reported personal funds as their primary source of financial support and 9 percent Federal funds; comparable figures for all doctorates were 26 percent and 7 percent.<sup>76</sup>

Among U.S. citizens who reported a primary source of support for their graduate education, about 37 percent of Hispanics and 47 percent of all new doctorate recipients reported that their university was the primary source of support (based on appendix B, table 63). Almost one-fourth of both Hispanics (31 percent) and all Ph.D.'s (20 percent) said that they used primarily personal funds. However, 13 percent of Hispanics and 5 percent of all new Ph.D.'s stated that they received Federal support.

## Postdoctoral Appointments

In 1990, there were 469 Hispanics holding postdoctoral appointments in science and engineering, up from 136 in 1977 (appendix B, table 70). Because of this huge increase, Hispanics accounted for 3.2 percent of S&E postdoctoral appointment holders in 1990, compared with 1.4 percent in 1977. By field, over half of Hispanic postdoctoral appointees held appointments in the life sciences; the remainder (25 percent) were concentrated primarily in the physical sciences.

# persons with physical disabilities in science and engineering<sup>1</sup>

The National Science Foundation's (NSF's) intent in collecting data on scientists and engineers with physical disabilities is to estimate the number who have a condition that may in some way limit their physical activity. Data on this population, however, are limited, for two major reasons. First, samples of these individuals are very small and therefore are subject to statistical uncertainty. Second, data on this population are based on self-reported responses to NSF surveys of scientists and engineers. Respondents are asked if they have a physical disability, and, if so, to specify the nature of that disability (visual, auditory, ambulatory, or other). These data therefore reflect individual perceptions.

Definition is another factor affecting data reliability. Specifically, ambiguous terminology makes precise measurement of the number of scientists and engineers who may have a physical disability very difficult. Frequently the terms *disability*, *impairment*, and *handicap* are used synonymously, but their meanings can have important differences. According to the World Health Organization, *impairment* is a "psychological, anatomical, mental loss, or some other abnormality."<sup>2</sup> *Disability* is any restriction on or lack of ability (resulting from impairment) to pursue an activity—such as work—in the manner or within the range considered normal. *Handicap* is a disadvantage resulting from an impairment or disability. Thus, an impairment subject to prejudice is a handicap, whether or not it is a disability.

## EMPLOYMENT CHARACTERISTICS

In 1986, the latest year for which data are available, about 94,200 scientists and engineers—2 percent of the total—reported having a physical disability (appendix B, table 74). The population surveyed in 1986 includes an experienced older group of scientists and engineers, and hence some increased disability. For example, 9 percent of the employed scientists and engineers in 1986 who reported their age were

60 years old or older.<sup>3</sup> Of the 94,200 reporting a disability in 1986, about 22 percent reported an ambulatory condition, 22 percent reported a visual condition, and almost 18 percent reported an auditory condition. The remainder did not specify the nature of their disability.

Estimates of the percentage of the U.S. population with disabilities<sup>4</sup> ranged from 15 percent to 17 percent among the general adult population<sup>5</sup> and from 4 percent to 11 percent among the college-aged population.<sup>6</sup> The proportion of the population with disabilities, both severe and nonsevere, increases with age. In 1991, the percentage of the U.S. population with disabilities ranged from 4 percent of persons aged 16 to 24 to 22 percent of those aged 55 to 64. This trend held for the decade (1981 to 1991) for which data are available (table 5-1).

Table 5-1. Severe and nonsevere work disabilities, by age: 1981-91

Year	Age									
	16-24		25-34		35-44		45-54		55-64	
	Non-severe	Severe	Non-severe	Severe	Non-severe	Severe	Non-severe	Severe	Non-severe	Severe
1981	2.1	1.4	2.9	2.3	3.8	3.4	5.8	6.5	9.2	14.4
1982	1.8	1.4	2.8	2.3	3.8	3.3	5.6	6.6	9.5	14.6
1983	2.0	1.5	2.7	2.1	4.1	3.0	5.0	6.4	8.6	14.7
1984	1.9	1.2	2.8	2.4	3.8	3.1	5.2	6.3	9.0	14.5
1985	2.2	1.4	2.6	2.2	3.8	3.5	5.4	6.2	10.0	13.7
1986	2.1	1.6	2.8	2.5	3.8	3.4	5.3	5.9	8.9	14.4
1987	1.8	1.7	2.8	2.6	3.9	3.6	5.0	5.9	8.6	13.6
1988	2.1	1.7	2.9	2.7	3.4	3.6	4.3	6.0	8.3	14.0

<sup>3</sup> National Science Foundation, *U.S. Scientists and Engineers: 1986*. Detailed Statistical Tables, NSF 87-322, 1987, table B-12, p.73.

<sup>4</sup> Disability is defined differently on the various Federal surveys used to provide estimates on characteristics of individuals with disabilities.

<sup>5</sup> National Science Foundation, *Report of the National Science Foundation Task Force on Persons With Disabilities*, October 1990, p. 17.

<sup>6</sup> National Science Foundation, *Report of the National Science Foundation Task Force on Persons With Disabilities*, October 1990, p. 17.

The representation of persons with impairments among recent S&E bachelor's, masters's, and doctorate recipients is 1 percent or less at each degree level (appendix B, table 75). No type of impairment (visual, auditory, ambulatory, or a combination of these) was more prevalent than the others.

### Labor Force Market Indicators

About 75 percent of the scientists and engineers reporting a physical disability in 1986 (70,300 of 94,200) were employed (appendix B, table 74). Two years earlier, about 91,600 had reported a physical disability; of those, about 74,800 (82 percent) were employed.<sup>7</sup> The labor force participation rate for the physically disabled thus declined from 83 percent in 1984 to 76 percent in 1986.<sup>8</sup> The corresponding rate for all scientists and engineers in 1986 was 95 percent. In 1987, approximately 2 percent of the 450,000 doctoral scientists and engineers reported that they were physically disabled.<sup>9</sup> Of these, 76 percent were employed; in comparison, 93 percent of all doctoral scientists and engineers were employed.

Persons reporting a disability are much more likely to be outside the labor force than are all scientists and engineers. In 1986, the reason cited by the largest percentage of the physically disabled (23 percent) for not being in the labor force was illness. Among all scientists and engineers, only about 2.6 percent cited illness as their major reason for not working or seeking work.<sup>10</sup>

Among those scientists and engineers who do enter the labor force and seek work, neither the physically disabled nor all scientists and engineers have much difficulty in finding jobs. In 1986, the unemployment rate for both groups was 1.5 percent.<sup>11</sup>

Even though the percentage of women with disabilities who are in the work force has been increasing steadily, women with disabilities are still considerably less likely than men with disabilities to be in the work force. In 1991, approximately 29 percent of women and 40 percent of men with disabilities were in the work force (table 5-2). About 26 percent of the men and women in the work force had disabilities labeled "nonsevere" and 15 percent had disabilities considered "severe."

**Table 5-2. Percent of disabled in the labor force, by sex and severity of disability, 1981-91**

Year	In the labor force		Employed full-time	
	Male	Female	Non-Severe	Severe
1981	41.9	23.5	29.8	11.4
1982	41.5	23.7	27.4	11.9
1983	41.0	24.4	26.2	11.2
1984	40.3	24.4	27.1	11.4
1985	38.2	25.3	25.5	12.0
1986	38.0	25.2	25.8	11.3
1987	39.7	27.1	26.3	12.7
1988	42.1	29.1	28.9	15.0
1989	41.4	30.3	28.2	15.0
1990	41.0	29.8	27.0	15.4
1991	39.5	29.3	26.3	15.1

### Field

The field distribution of those reporting a physical disability differs only slightly from that of all scientists and engineers (chart 5-1). Those with a disability are about as likely to be scientists as to be engineers. Among science fields, those with a physical disability are somewhat more likely to be psychologists and less likely to be mathematical or environmental scientists.

**Chart 5-1. Field distribution of all employed scientists and engineers and employed scientists and engineers with physical disabilities: 1986**

<sup>1</sup> Includes industrial, materials, mining, nuclear, petroleum, and other

<sup>10</sup> STPDS, 1986, unpublished tabulations.

<sup>11</sup> STPDS, 1986, unpublished tabulations.

## POSTSECONDARY EDUCATION

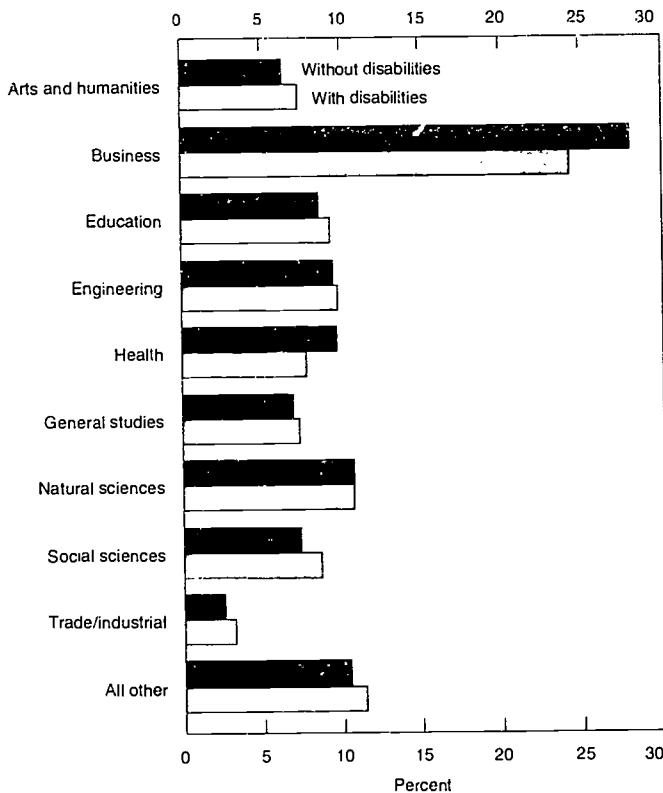

In the fall of 1986, approximately 10.5 percent of the 11.2 million students enrolled in postsecondary institutions were classified as having a disability (table 5-3). Forty-nine percent of students with a disability were women, whereas 55 percent of students without a disability are women.<sup>12</sup> Students with disabilities tended to be older than students without disabili-

**Table 5-3. Disabled postsecondary students, by type of disability: fall 1986**

Type of disability	Prevalence of disability	Percentage of all students	Percentage of disabled students
Total, any disability	1,319,229	10.5	
Learning disability	160,878	1.3	12.2
Visual handicap	514,681	4.1	39.0
Hard of hearing	265,484	2.1	20.1
Deafness	80,910	0.6	6.1
Speech disability	62,525	0.5	4.7
Orthopedic handicap	231,491	1.8	17.6
Health impairment	320,272	2.6	24.3

NOTE: Details do not add to total because some students had multiple disabilities.

**Chart 5-2. Major field of study of undergraduate students, by disability status: fall 1986**

SOURCE: Based on appendix B, table 76

Information on gender and age of students with disabilities is from U.S. Department of Education, National Center for Education Statistics, Profile of Handicapped Students in Postsecondary Education, 1987, CS 89-337, June 1989.

ties: approximately one out of three students with a disability was at least 30 years old, whereas only one of every four students without a disability fell into this age range.

The most prevalent disability among postsecondary students in 1986 was a visual impairment: 39 percent listed this as their type of disability (table 5-3). Approximately one-fourth of the students with disabilities reported that their health was impaired, and about the same percentage, one-fifth, reported that they were hard of hearing or had an orthopedic disability.

In the fall of 1986, about 11 percent of all undergraduates and 8 percent of all graduate students were listed as having a disability (based on appendix B, table 76). At the undergraduate level, about 40 percent of students with disabilities were majoring in science fields and education. For example, 11 percent of students with disabilities were majoring in the natural sciences, 10 percent in engineering, 9 percent in social science, and 9 percent in education (chart 5-2). The distribution of major fields was similar for persons without disabilities: again, 11 percent had a natural science major, 10 percent an engineering major, and 9 percent an education major. However, students without disabilities were slightly less likely to major in social science (7 percent).

Graduate students with disabilities majored in science and engineering fields at a slightly lower rate than did those without disabilities (chart 5-3). For example, 25 percent were

**Chart 5-3. Major field of study of graduate students, by disability status: fall 1986**

SOURCE: Appendix B, table 76

enrolled in the natural sciences (10 percent), the social sciences (10 percent), and engineering (5 percent). Among students without disabilities, 28 percent were science and engineering majors; 12 percent were majoring in the natural sciences, 10 percent in social sciences, and 6 percent in engineering. The largest proportion of students, both with (25 percent) and without (22 percent) physical disabilities, were education majors.

## **CONCEPTS AND DEFINITIONS**

The National Science Foundation (NSF) publishes a variety of data relating to scientists and engineers. These data—which include estimates of graduate enrollments and degree production as well as the number, work activities, sector of employment, and other economic and demographic characteristics of scientists and engineers—are developed by the Division of Science Resources Studies as part of its ongoing programs. This section presents a brief examination of the major NSF data resources used in this report.

## **SCIENCE AND ENGINEERING PERSONNEL**

Estimates of the characteristics of scientists and engineers in the United States were produced by NSF's Scientific and Technical Personnel Data System (STPDS). Broadly speaking, a person who meets at least two of the following criteria is considered a scientist or engineer:

- (1) The person has a degree in science (including social science) or engineering.
- (2) The person is employed in a science or engineering occupation.
- (3) The person is professionally identified as a scientist or engineer based on his or her total education and experience.

### **National Estimates**

The STPDS comprises three subsystems, each designed to measure the characteristics of a particular subpopulation:

- *The Experienced Sample of Scientists and Engineers* is the biennial followup survey to the 1982 Postcensal Survey of Scientists and Engineers. The Postcensal Survey sample was drawn from those individuals who were in the science and engineering (S&E) population at the time of the 1980 census. The Postcensal Survey and the 1984, 1986, 1989 Experienced Sample surveys were conducted for NSF by the Bureau of the Census.
- *The Survey of Recent Science and Engineering Graduates* is designed to measure the magnitude and characteristics of those who earned S&E degrees after the 1980 decennial census was completed. During the eighties and in

1990, the Institute for Survey Research, Temple University, conducted this survey series for NSF. The most recent survey (1990) focuses on the graduating classes of 1988 and 1989.

- *The Survey of Doctorate Recipients* provides information on scientists and engineers granted doctorates in the United States over a 42-year period. The most recent survey, conducted in 1989, covered those individuals who received their doctorates between 1946 and 1988. Since 1973, this survey series has been conducted biennially for NSF by the Office of Scientific and Engineering Personnel, National Academy of Sciences.

To produce national estimates, data from the Experienced Sample and Recent Graduate surveys are integrated by means of a computer-based model. The Science and Engineering Tabulating (SETAB) Model, developed for NSF by Mathematica Policy Research, Inc., was used to generate national estimates for 1982, 1984, and 1986.

Many of the data on employment characteristics of the overall population of scientists and engineers have not been updated since 1986. One of the major surveys needed for generating these estimates is the Experienced Sample of Scientists and Engineers, a panel survey of individuals selected from the 1980 Census. Panel surveys are subject to sample degradation over time; that is, the percentage responding tends to decline. Preliminary evaluation of the 1989 Survey has raised serious questions about the reliability of the results of the survey. The National Science Foundation has, therefore, decided not to publish data from this series pending a more thorough evaluation, which is currently under way.

### **Selected Variable Definitions**

#### ***Field of Science and Engineering***

Data on field of employment are derived from responses to survey questions that ask the name of the specialty most closely related to the respondent's principal employment. The specialty is chosen from a list provided in each questionnaire. Fields are classified as follows:

- *Physical science*: chemistry, physics, astronomy, and other physical sciences, including metallurgy
- *Mathematical science*: mathematics and statistics

- *Computer specialties*
- *Environmental science*: earth, atmospheric, and oceanographic sciences, including geophysics, seismology, and meteorology
- *Life science*: biological, agricultural, and medical sciences, excluding those having to do with patient care
- *Psychology*
- *Social science*: economics, including agricultural economics; sociology; anthropology; and all other social sciences
- *Engineering*: aeronautical/astronautical, chemical, civil, electrical/electronics, materials science, mechanical, nuclear, petroleum, and other engineering

### **Work Activities**

Data on work activities of scientists and engineers represent their primary work activities. These data are derived from responses to survey questions that ask individuals to select from a list of 10 to 15 choices their primary work activities. Work activities are classified as follows:

- *Research and development (R&D)*: basic research; applied research; development; and design of equipment processes and models
- *Management of R&D*: management or administration of research and development
- *General management*: management or administration of activities other than research and development
- *Teaching*: teaching and training
- *Production/inspection*: quality control, testing, evaluation, or inspection; and operations including production, maintenance, construction, installation, and exploration
- *Reporting, statistical work, and computing*: report and technical writing, editing, and information retrieval; statistical work, including survey work, forecasting, and statistical analysis; computer applications

Additional work activities for which information is collected include distribution (sales, traffic, purchasing, customer and public relations), consulting, and other activities.

### **Statistical Measures**

#### ***Labor Force Participation Rate***

The labor force is defined as those who are employed and those who are seeking employment. The labor force participation rate is the number of those employed and those unemployed expressed as a percentage of the population.

#### ***Unemployment Rate***

The unemployment rate is the number of those who are unemployed but seeking employment expressed as a percentage of the total labor force.

### ***S&E Underemployment Rate***

The S&E underemployment rate is the number of scientists and engineers who are working part-time but seeking full-time jobs, or who are working in non-S&E jobs when S&E jobs would be preferred, expressed as a percentage of the total employed S&E population.

### **Reliability of Science and Engineering Estimates**

Estimates of scientists and engineers are derived from sample surveys and thus are subject to both sampling and nonsampling errors.

#### ***Sampling Errors***

The sample used for a particular survey is only one of many possible samples of the same size that could have been selected using the same sample design. Even if the same questionnaire and instructions were used, the estimates from each of the samples would differ. The deviation of the estimated sample from the average of all possible samples is defined as "sampling error." The standard error of a survey estimate attempts to provide a measure of this variation. Standard errors are thus indicators of the degree of precision with which a sample estimate approximates the average results for all possible samples.

#### ***Nonsampling errors***

Nonsampling errors may be attributed to many sources: inability to obtain information about all cases; definitional difficulties; differences in the interpretation of questions; respondents' inability or unwillingness to provide correct information; mistakes in recording or coding information; and other errors in collection, response, processing, coverage, and imputation.

Nonsampling errors are not unique to samples; they can occur in complete canvasses as well. No systematic attempt has been made to identify or approximate the magnitude of nonsampling errors associated with the estimates of scientists and engineers presented in this report.

## **GRADUATE ENROLLMENT**

National estimates of graduate S&E enrollments are from the Annual Survey of Graduate Science and Engineering Students and Postdoctorates, currently conducted for NSF by Quantum Research Corporation. The survey universe is composed of all institutions in the United States with departments or programs offering courses of study at the postbaccalaureate level in any S&E field. Included are medical schools and other specialized institutions offering first-professional doctorates in health-related fields. Surveys are sent to academic departments, which provide information on the students enrolled in programs in the department. Fields included in summary tables from this survey are listed below.

- *Physical science*: chemistry, physics, astronomy, and other physical sciences

- *Mathematical sciences*
- *Computer sciences*
- *Earth, atmospheric, and oceanographic sciences:* atmospheric science, geosciences, and oceanography
- *Agricultural sciences*
- *Biological sciences:* anatomy, biochemistry, biology, biometry/epidemiology, biophysics, botany, cell biology, ecology, entomology, parasitology, genetics, microbiology, nutrition, pathology, pharmacology, physiology, zoology, and other biosciences
- *Psychology*
- *Social science:* agricultural economics, anthropology, economics, geography, history and philosophy of science, linguistics, political science, sociology, sociology/anthropology, and other social sciences
- *Engineering:* aerospace, agricultural, biomedical, chemical, civil, and electrical engineering; engineering science; industrial, mechanical, metallurgical/materials, mining, nuclear, petroleum, and other engineering

## ADDITIONAL INFORMATION ON NATIONAL SCIENCE FOUNDATION DATA SOURCES

A brief description of each survey and copies of the survey instruments may be found in *A Guide to NSF Science Resources Data*. The *Guide* and reports for each survey are available from the Office of the Division Director, Division of Science Resources Studies, National Science Foundation, 1800 G Street N.W., Room L-609, Washington, DC 20550. The survey reports generally include detailed statistical tables and information on the survey methodology.

## EARNED DEGREES

### Bachelor's and Master's Degrees

Data on earned degrees in science and engineering at the bachelor's and master's level are collected by the National Center for Education Statistics (NCES) of the U.S. Department of Education through its Other Formal Awards Conferred Survey and Completion Survey. The two surveys are conducted annually as part of the NCES Higher Education General Information Survey and Integrated Postsecondary Education Data System, respectively. These data cover earned degrees conferred in the aggregate United States, which includes the 50 States, the District of Columbia, and outlying territories. Degree data are compiled for the 12-month period from July through the following June. For a list of disciplines included in fields presented in tables on bachelor's and master's degrees, see *Science and Engineering Degrees: 1966-89, A Source Book*, Survey of Science Resources series, National Science Foundation, NSF 91-314, 1990.

### Doctorates

Data on doctorates granted in science and engineering are developed from the Survey of Earned Doctorates, which is conducted for NSF by the National Academy of Sciences. These data cover all types of doctoral degrees, with the exception of such first-professional degrees as the J.D. or M.D. Data are collected for the aggregate United States and cover the period from July to the following June. Lists of disciplines included in fields are available in NSF Sources footnoted in tables.

NA = not available; double dashes (--) represent too few cases to estimate.

(1) Racial/ethnic categories will not sum to total because

(a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and

(b) total employed includes "other" and "no report" categories.

(2) Includes members of all racial groups

NOTE: Detail may not sum to totals because of rounding.

Double dashes (--) represent too few cases to estimate; cells with less than 20 cases are not reported.

- (1) Includes scientists and engineers who received their doctorates between 1946 and 1988 and were employed full-time or part-time or held postdoctoral appointments in February 1989. All holders of doctorates are included, regardless of citizenship status (i.e., U.S. citizen; non-U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa). Field categories represent the specialty most closely related to the respondent's principal employment. Individuals who did not report S&E employment were assigned the specialty of their doctoral degree.
- (2) Racial/ethnic categories will not sum to total because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total employed includes "other" and "no report" categories.
- (3) Includes members of all racial groups

Hispanic (2)	4,000	--	1,600	1,200	800	--	100	--	--	--
Engineers, total	99,000	3,300	32,500	31,300	12,100	5,300	2,900	2,100	2,800	2,200
White	84,100	2,700	28,200	26,900	10,100	4,600	2,400	1,400	2,500	2,200
Black	4,400	100	1,000	1,300	300	300	--	--	100	--
Asian	7,300	300	1,900	1,900	1,400	400	400	700	100	--
Native American	300	--	100	100	100	--	--	--	--	--
Hispanic (2)	3,200	100	1,100	1,200	400	100	100	--	--	--

Double dashes (--) represent too few cases to estimate.

- (1) Detail will not add to total employed because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total employed includes "other" and "no report" categories.
- (2) Includes members of all racial groups

NOTE: All figures have been rounded to the nearest 100. Detail may not sum to totals because of rounding.

SOURCE: National Science Foundation, Science Resources Studies Division, Scientific and Personnel Data System (STPDS). Tabulations are published in Women and Minorities in Science and Engineering, NSF 90-301, January 1990, appendix B, table 9, pp. 81-82.

Hispanic (5)	1,274	103	163	255	295	222	118	65	--	--	--

Double dashes (--) represent too few cases to estimate; cells with fewer than 20 cases are not reported.

- (1) See appendix A, "Technical Notes," page 69, for a list of fields included in the general field categories.
- (2) Includes scientists and engineers who received their doctorates between 1946 and 1988 and were employed full-time or part-time or held postdoctoral appointments in February 1989. All holders of doctorates are included, regardless of citizenship status (i.e., U.S. citizen; non-U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa).
- (3) "Years of professional experience" categories will not sum to total employed scientists and engineers because the total includes "no reports."
- (4) Racial/ethnic categories will not sum to total employed doctoral scientists and engineers because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total employed includes "other" and "no report" categories.
- (5) Includes members of all racial groups

Asian	14,139	649	2,204	3,303	2,965	2,314	1,405	657	131	83	--
Native American	69	--	--	--	35	--	--	--	--	--	--
Hispanic (5)	1,211	91	149	226	287	222	118	65	--	--	--

Double dashes (--) represent too few cases to estimate; cells with fewer than 20 cases are not reported.

- (1) See appendix A, "Technical Notes," page 69, for a list of fields included in the general field categories.
- (2) Includes scientists and engineers who received their doctorates between 1946 and 1988 and were employed full-time or part-time or held postdoctoral appointments in February 1989. All holders of doctorates are included, regardless of citizenship status (i.e., U.S. citizen; non-U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa).
- (3) "Years of professional experience" categories will not sum to total employed scientists and engineers because the total includes "no reports."
- (4) Racial/ethnic categories will not sum to total employed doctoral scientists and engineers because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total employed includes "other" and "no report" categories.
- (5) Includes members of all racial groups

Black	41,300	1,100	11,700	3,500	7,100	600	9,700	3,200
Asian	132,800	7,500	47,400	11,400	19,300	4,600	19,500	6,400
Native American	13,300	200	3,500	800	2,800	--	2,500	600
Hispanic	47,200	2,400	12,000	3,200	9,000	1,100	10,400	2,900

Double dashes (--) represent too few cases to estimate.

(1) Includes "consulting," "other," and "no report" categories.

(2) Detail will not add to total employed because

(a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and

(b) total employed includes "other" and "no report" categories.

(3) Includes members of all racial groups

NOTE: All figures have been rounded to the nearest 100. Detail may not sum to totals because of rounding.

Native American	--	--	--	--
Hispanic (5)	495	273	124	--

Double dashes (--) represent too few cases to estimate; cells with fewer than 20 cases are not reported.

- (1) See appendix A, "Technical Notes," page 69, for a list of fields included in general field categories.
- (2) Racial/ethnic categories will not sum to total because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total includes "other" and "no report" categories.
- (3) Includes doctoral scientists and engineers who received their doctorates between 1946 and 1988 and were employed full-time or part-time or holding postdoctoral appointments in February 1989 in 4-year institutions of higher education. All holders of doctorates are included, regardless of citizenship status (i.e., U.S. citizen; non-U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa).
- (4) Tenure status categories will not sum to total because total includes "tenure not applicable" and "no report" categories.
- (5) Includes members of all racial groups
- (6) Includes agricultural, biological, and medical scientists

Table 20. Female doctoral scientists and engineers in four-year colleges and universities, by field, racial/ethnic group, and academic rank: 1989

Field (1) and racial/ethnic group	Academic rank			
	Total, four-year colleges and universities (2,3,4)	Full professor	Associate professor	Assistant professor
Social scientists	9,769	2,046	3,043	2,921
White	8,920	1,918	2,791	2,600
Black	395	55	131	140
Asian	361	57	82	149
Native American	22	--	--	--
Hispanic (5)	276	--	96	116
Engineers, total	679	90	133	290
White	555	76	116	250
Black	--	--	--	--
Asian	114	--	--	33
Native American	--	--	--	--
Hispanic (5)	21	--	--	--

Double dashes (--) represent too few cases to estimate; cells with fewer than 20 cases are not reported.

- (1) See appendix A, "Technical Notes," page 69, for a list of fields included in general field categories.
- (2) Includes doctoral scientists and engineers who were employed full-time or part-time or holding post-doctoral appointments at 4-year institutions of higher education in February 1989. All holders of doctorates are included, regardless of citizenship status (i.e., U.S. citizen; non-U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa).
- (3) Academic rank categories will not sum to the total employed because the total includes "other faculty ranks" and "no report" categories.
- (4) Racial/ethnic categories will not sum to the total employed category because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total employed includes "other" and "no report" categories.
- (5) Includes members of all racial groups

Hispanic (6)	95.6	95.8	93.4	1.2	1.0	3.2	1.4	1.5	0.8

Double dashes (--) represent too few cases to estimate.

- (1) See appendix A, "Technical Notes," page 69, for a list of fields included in general categories.
- (2) The labor force is defined as those who are employed and those who are seeking employment. The labor force participation rate is the number of those employed and those unemployed expressed as a percentage of the population.
- (3) The unemployment rate is the number of those who are unemployed but seeking employment expressed as a percentage of the total labor force.
- (4) The S&E underemployment rate is the number of scientists and engineers who are working part-time but seeking full-time jobs, or who are working in non-S&E jobs when S&E jobs would be preferred, expressed as a percentage of total employment.
- (5) Detail will not average to total because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total employed includes "other" and "no report" categories.
- (6) Includes members of all racial groups

Double dashes (--) represent too few cases to estimate.

- (1) For fields included in general field categories, see Characteristics of Science and Engineering Graduates: 1990, National Science Foundation, Science Resources Studies Division, (forthcoming 1992).
- (2) The labor force is defined as those who are employed and those who are seeking employment. The labor force participation rate is the number of those employed and those unemployed expressed as a percentage of the population.
- (3) The unemployment rate shows the ratio of those who are unemployed but seeking employment to the total labor force.
- (4) Includes graduates, except full-time graduate students, who received their degrees in academic year 1988 or 1989.
- (5) Racial and ethnic categories will not average to total because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total includes "other" and "no report" categories.
- (6) Includes members of all racial groups

Engineers, total	62,500	64,300	55,700	58,400	--	55,400
Male	62,800	65,000	55,500	58,600	--	55,600
Female	53,400	53,200	--	54,000	--	50,100

Double dashes (--) represent too few cases to estimate; medians were not calculated for cells with fewer than 20 cases.

- (1) See appendix A, "Technical Notes," page 69, for a list of fields included in the general field categories.
- (2) Includes civilian scientists and engineers who received their doctorates between 1946 and 1988 and were employed full-time in February 1989. All holders of doctorates are included, regardless of citizenship status (i.e., U.S. citizen; non-U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa).
- (3) Median salaries of racial/ethnic categories will not average to total because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics' salaries may also be included in the salaries of one of the racial groups) and
  - (b) the total median salary includes salaries for "other" and "no report" categories.
- (4) Includes members of all racial groups

NOTE: All figures have been rounded to the nearest 100. Median salaries are for full-time employed civilians only.

Table 32. Achievement test scores in science and mathematics for college-bound seniors,  
by sex and racial/ethnic group: 1991

Achievement and SAT-Math tests	Total	Male	Female	White	Black	Asian	Native American	Mexican American	Puerto Rican	Latin American
Chemistry SAT-Math (1)	575 645	592 662	547 617	577 646	503 557	586 661	525 600	516 591	504 584	537 603
Biology SAT-Math (1)	561 601	579 628	546 577	565 602	496 513	562 622	509 551	497 534	503 519	543 564
Physics SAT-Math (1)	601 668	615 676	556 643	603 670	533 592	606 682	561 631	522 595	534 594	568 636
Mathematics Level I SAT-Math (1)	549 569	570 595	531 546	554 578	486 494	573 584	509 530	481 483	505 519	509 517
Mathematics Level II SAT-Math (1)	666 654	682 672	644 628	667 658	596 576	682 662	636 631	599 574	627 610	631 608

(1) Mean score on the math portion of the Scholastic Aptitude Test for seniors who took achievement test in subject.

NOTE: The score range is 200 to 800 for both the achievement test and the math portion of the SAT.

SOURCE: Admissions Testing Program of the College Entrance Examination Board, College Bound Seniors, 1991 Profiles of SAT and Achievement Test Takers (Princeton, NJ: Educational Testing Service, 1991), p. 11  
Scores are from separate reports for each sex and racial/ethnic group.

Table 33. Average advanced placement test grades in science and math fields, by sex and racial/ethnic group: 1990

Advanced placement test fields	Total	Male	Female	White	Black	Asian	Native American	Mexican American	Puerto Rican	Other Hispanic
Biology	2.96	3.13	2.80	2.97	2.07	3.17	2.50	2.20	2.41	2.47
Chemistry	2.94	3.09	2.65	2.93	1.96	3.20	2.20	2.10	2.49	2.34
Physics B	2.80	2.96	2.37	2.79	2.05	2.97	2.04	2.13	2.42	2.23
Physics C-Mechanics	3.36	3.47	2.90	3.38	2.44	3.49	2.13	2.45	2.82	2.79
Physics C-Electricity and Magnetism	3.32	3.38	3.01	3.33	2.75	3.34	1.50	2.65	2.42	2.97
Mathematics/Calculus AB	3.23	3.35	3.07	3.24	2.31	3.43	2.51	2.72	2.79	2.88
Mathematics/Calculus BC	3.65	3.74	3.48	3.65	3.08	3.72	3.52	3.18	3.20	3.43
Computer Science AB	2.81	2.90	2.35	2.88	2.04	2.74	2.23	2.25	2.05	2.06
Computer Science A	2.92	3.03	2.37	3.00	1.80	2.94	2.50	1.94	2.07	2.24

NOTE: The grading scale may be interpreted as follows:  
 1=no recommendation for college credit; 2=possibly qualified; 3=qualified; 4=well qualified; and  
 5=extremely well qualified. Average grades are for test takers at the 9th-, 10th-, 11th-, and 12th-  
 grade and college levels.

(1) Includes freshmen at all 4-year colleges

(2) Racial and ethnic categories may total to more than 100 because students could select more than one category.

(3) Data by racial/ethnic group are not reliable for those students whose intended major is a science or engineering field because of very small sample sizes.

(4) "Other" includes "none," "associate" and "divinity" degrees, and other degrees not listed.

SOURCES: Cooperative Institutional Research Program, Graduate School of Education, University of California, Los Angeles, The American Freshmen Norm Survey. Racial/ethnic data and data for 1980 and 1990 freshmen planning a science or engineering major are from unpublished tabulations generated from the Freshmen Norm Survey data base. All other 1980 figures are from Alexander W. Astin, Margo R. King, and Gerald T. Richardson, *The American Freshman: National Norms for Fall 1980* (Los Angeles, CA: Cooperative Institutional Research Program, Graduate School of Education, University of California, Los Angeles, 1980). All other figures for 1990 are from the 1990 edition of the same publication.

See explanatory information and SOURCE on next page.

- 
- (1) Data on racial/ethnic groups are collected by broad fields of study only; therefore, cannot be grouped using the exact field taxonomies reported in tables 38-40.
  - (2) Racial/ethnic categories are designated on the survey form. Data are provided by institutions. These categories include U.S. citizens and foreign citizens on permanent visas (resident aliens who have been admitted for permanent residency).
  - (3) Figures will not equal those in tables 38-40 because the field taxonomies are not the and may contain more fields.
  - (4) For 1979 and 1981, social sciences include "Afro-American black cultural studies" and "American Indian studies."
  - (5) Includes degrees in engineering technology. Racial/ethnic data for engineering and engineering technology separately are available for 1985-89 only.

NOTES: Data by racial/ethnic group were collected biennially from 1977 to 1989, but data for 1983 were not released by the National Center for Education Statistics.

SOURCE: U.S. Department of Education, National Center for Education Statistics (NCES). Biennial data are from the Higher Education General Information System (HEGIS) "Earned Degrees Survey," 1979-85, and the Integrated Postsecondary Education Data System (IPEDS) "Completions Survey," 1987-1989. Tabulations were done by the National Science Foundation, Science Resources Studies Division, and are unpublished.

Table 51. Science and engineering master's degree recipients, by field of degree and racial/ethnic group: 1979, 1981, 1985, 1987, and 1989

- 
- (1) Data on racial/ethnic groups are collected by broad fields of study only; therefore, fields cannot be grouped using the exact field taxonomies reported in tables 48-50.
  - (2) Racial/ethnic categories are designated on the survey form. Data are provided by institutions. These categories include U.S. citizens and foreign citizens on permanent visas (resident aliens who have been admitted for permanent residency).
  - (3) Figures will not equal those in tables 48-50 because the field taxonomies are not the same and may contain more fields.
  - (4) For 1979 and 1981, social sciences included "Afro-American black cultural studies" and "American Indian studies."
  - (5) Includes degrees in engineering technology. Racial/ethnic data for engineering and engineering technology separately are available for 1985-1989 only.

NOTES: Data by racial/ethnic group were collected biennially from 1977 to 1989, but data for 1983 were not released by the National Center for Education Statistics.

SOURCE: U.S. Department of Education, National Center for Education Statistics (NCES). Biennial data are from the Higher Education General Information System (HEGIS) Earned Degrees Survey, 1979-85, and Integrated Postsecondary Education Data System (IPEDS) Completion Survey, 1987-89. Tabulations were done by the National Science Foundation, Science Resources Studies Division, and are unpublished.

Double dashes (--) indicate that no doctorates were reported.

(1) Hispanics are counted separately in doctorate degree data.

NOTE: "Personal" includes loans as well as own earnings and contributions from spouse or family. Federally funded research assistantships (RAs) are grouped under "University" because recipients of such support may not be aware of the actual source of funding. It is believed that many of these recipients are reporting their support as university RA instead of Federal RA. "Other" support includes U.S. nationally competitive fellowships, business or employer funds, foreign government funds, and other nonspecified sources.

SOURCE: National Research Council, Office of Scientific and Engineering Personnel, Survey of Earned Doctorates. Figures are from unpublished tabulations and from Delores H. Yhurgood and Joanne Weinman, Summary Report 1990: Doctorate Recipients from United States Universities, (Washington, DC: National Academy Press, 1991).

Environmental	495	431	64	421	--	71	--	32
Life	8,798	5,829	2,969	7,440	128	1,147	22	245
Psychologists	894	361	533	855	--	32	--	--
Social (4)	503	400	103	459	--	20	--	--
Engineers, total	651	594	57	290	26	327	--	--

Double dashes (--) represent too few cases to estimate; cells with fewer than 20 cases are not reported.

- (1) See appendix A, "Technical Notes," p. 69, for a list of fields included in general field categories. Field represents the specialty most closely related to the respondent's postdoctoral appointment. Individuals who did not report a S&E appointment were assigned the specialty of their doctorate.
- (2) Includes all doctorate holders with postdoctoral appointments, regardless of citizenship status (i.e., U.S. citizen; non U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa)
- (3) Racial/ethnic details will not sum to total because
  - (a) racial and ethnic categories are not mutually exclusive (Hispanics may also be included in one of the racial groups) and
  - (b) total employed includes "other" and "no report" categories.
- (4) Includes agricultural economics

Double dashes (--) represent too few cases to estimate; cells with fewer than 20 cases are not reported.

(1) See appendix A, "Technical Notes", page 69, for a list of fields included in the general field categories. Field represents the specialty most closely related to the respondents principal employment.

Individuals who did not report S&E employment were assigned the specialty of their doctoral degree.

(2) Includes scientists and engineers who received their doctorates between 1946-1988 and were employed full-time or part-time or held postdoctoral appointments in February 1989. All doctorates are included, regardless of citizenship status (i.e., U.S. citizen; non-U.S. citizen, permanent visa; and non-U.S. citizen, temporary visa).

NOTE: Median salaries are computed for full-time employed civilians only. All figures have been rounded.

Table 75. Self-identified physical impairments of science and engineering graduates, by type and degree level

Page 1 of 1

	Bachelor's recipients (1) (Total = 628,000)	Master's recipients (1) (Total = 114,200)	Doctorate recipients (2) (Total = 39,600)
Percent with physical impairments, total (3)	1.0	0.4	1.0
Visual only	0.2	0.1	0.3
Auditory only	0.2	0.1	0.2
Ambulatory only	0.3	0.1	0.3
Multiple impairments	--	--	--

Double dashes (--) represent less than 0.1 percent.

(1) Bachelor's and master's degree recipients in 1988 who received their degrees in 1986 or 1987

(2) Doctorate recipients include those who received their doctorates in 1987 and 1988.

(3) Total includes respondents whose specific impairment was not reported

SOURCE: National Science Foundation, Division of Science Resources Studies, Survey of Recent Science and Engineering Graduates (1986-87 Graduates in 1988), and Survey of Earned Doctorates (new Ph.D. recipients in 1987 and 1988), special tabulations

Table 76. Postsecondary students, by major field of study and disability status: fall 1986

Field of study	Students without disabilities		Students with disabilities (1)	
	Number	Percent	Number	Percent
Undergraduates				
	10,015,143	100.0	1,207,083	100.0
Arts and humanities	640,329	6.4	89,414	7.4
Business	2,811,444	28.1	294,823	24.4
Education	860,442	8.6	112,371	9.3
Engineering	950,488	9.5	118,413	9.8
Health	970,498	9.7	94,247	7.8
General studies	690,355	6.9	88,205	7.3
Natural sciences (2)	1,070,550	10.7	129,287	10.7
Social sciences	730,375	7.3	103,913	8.6
Trade/industrial	250,128	2.5	38,665	3.2
All other	1,040,534	10.4	137,745	11.4
Graduates				
	974,056	100.0	89,090	100.0
Arts and humanities	93,509	9.6	9,533	10.7
Business	208,448	21.4	12,116	13.6
Education	218,189	22.4	22,629	25.4
Engineering	62,340	6.4	4,098	4.6
Natural sciences (2)	116,887	12.0	9,087	10.2
Social sciences	92,535	9.5	8,820	9.9
All other	182,148	18.7	22,807	25.6

(1) Includes students who reported that they had one or more of the following conditions: a specific learning disability, a visual handicap, hard of hearing, deafness, a speech disability, an orthopedic handicap, or a health impairment.

(2) Includes students who majored in life sciences, physical sciences, mathematics, or computer sciences

NOTE: Detail may not add to totals because of rounding.

## What is STIS?

STIS is an electronic dissemination system that provides fast, easy access to National Science Foundation (NSF) publications. There is no cost to you except for possible long-distance phone charges. The service is available 24 hours a day, except for maintenance periods.

## What Publications are Available?

Publications currently available include:

- The *NSF Bulletin*
- Program announcements and "Dear Colleague" letters
- General publications and reports
- *NSF Directions*
- Press releases
- NSF organization charts and phone books
- NSF vacancy announcements
- Award abstracts (1989—now)

The goal is for all printed publications to be available electronically.

## Access Methods

There are four ways to access STIS. Choose the method that meets your needs and the communication facilities you have available.

**Electronic Documents Via E-Mail.** If you can send E-mail to Internet or BITNET addresses you can send a specially formatted message, and the document you request will be automatically returned to you via E-mail.

**Anonymous FTP.** Internet users who are familiar with this file transfer method can quickly and easily transfer STIS documents to their local system for browsing and printing.

**On-Line STIS.** If you have a VT100 emulator and an Internet connection or a modem, you can log on to the on-line system. The on-line system features full-text search and retrieval software to help you locate the documents and award abstracts that are of interest to you. Once you locate a document, you can browse through it on-line or download it using the Kermit protocol or request that it be mailed to you.

**Direct E-Mail.** You can request that STIS E-mail you an electronic copy of every document that is added to the system. This is particularly effective for periodic and time-sensitive publications such as the *Bulletin*.

## Getting Started With Documents Via E-Mail

Send a message to [stisserv@nsf.gov](mailto:stisserv@nsf.gov) (Internet) or [stisserv@NSF](mailto:stisserv@NSF) (BITNET). The *text* of the message should be as follows (the Subject line is ignored):

Request: stis  
Topic: index

You will receive a list of all the documents on STIS and instructions for retrieving them. Please note that all requests for electronic documents should be sent to [stisserv](mailto:stisserv), as shown above. Requests for *printed* publications should be sent to [pubs@nsf.gov](mailto:pubs@nsf.gov) (Internet) or [pubs@NSF](mailto:pubs@NSF) (BITNET), and include the document name, number, and your postal address.

## Getting Started with Anonymous FTP

FTP to [stis.nsf.gov](ftp://stis.nsf.gov). If you cannot connect, try [128.150.195.40](tel:128.150.195.40). Enter *anonymous* for the username, and your E-mail address for the password.

Retrieve the file *ftpindex*. This contains a list of the files available on STIS and additional instructions.

## Getting Started with the On-Line System

**If you are on the Internet:** [telnet stis.nsf.gov](telnet://stis.nsf.gov). If you cannot connect, try [telnet 128.150.195.40](telnet://128.150.195.40). At the login prompt, enter *public*.

**If you are dialing in with a modem:** Choose 1200, 2400, or 9600 baud, 7-E-1. Dial 202-357-0359 or 202-357-0360. When connected, press Enter. At the login prompt, enter *public*.

## Getting Started with Direct E-Mail

Send an E-mail message to [stisserv@nsf.gov](mailto:stisserv@nsf.gov) (Internet) or [stisserv@NSF](mailto:stisserv@NSF) (BITNET). The Subject field will be ignored. Put the following in the message text:

Request: stis  
Topic: stisdirm

You will receive instructions for this service.
