Chapter 1 Scattering of X-rays and Neutrons	3
1.1 Outline of this chapter	3
1.2 Introduction to the theory of X-ray scattering	3
1.2.1 Classical treatment of X-ray scattering	3
1.2.2 Quantum-mechanical treatment: the first Born approximation	5
1.2.3 Scattering by a periodic crystal	7
1.2.4 The structure factor formalism in terms of atomic densities	9
1.3 Resonance scattering of X-rays	11
1.3.1 Classical treatment	11
1.3.2 Quantum-mechanical treatment: the second Born approximation	13
1.3.3 The power series expansion of the scattering operator	15
1.3.4 The optical theorem and the relation between f'' and f'	16
1.4 Neutron scattering	18
1.4.1 Properties of neutrons	18
1.4.2 The neutron scattering length	19
Chapter 2 The Effect of Thermal Vibrations on the Intensities of the Diffracted Beams	22
2.1 The normal modes of a crystal	23
2.1.1 Phonons, internal and external modes	23
2.1.2 The frequency of the normal modes	23
2.2 The effect of thermal vibrations on the Bragg intensities	27
2.2.1 The Born–Oppenheimer approximation	27
2.2.2 The harmonic temperature factor	28

2.2.3	Beyond the harmonic approximation	31
2.2.4	Comparison of the anharmonic formalisms	36
2.2.5	Quantum-statistical treatments	37
2.3	The relation between the atomic temperature factors and lattice dynamics	40
2.3.1	General expression	40
2.3.2	The Debye approximation	41
2.3.3	The rigid-body model for molecular crystals	42
2.3.4	The rigid-bond test	48
Chapter 3 Chemical Bonding and the X-ray Scattering Formalism 49		
3.1	The breakdown of the independent-atom model	49
3.1.1	Qualitative considerations	49
3.1.2	The electron density and the LCAO formalism	51
3.2	Improved scattering models	55
3.2.1	The spherical atom kappa formalism	55
3.2.2	Modified spherical scattering factor for the hydrogen atom	56
3.2.3	Examples of results obtained with the κ -formalism	57
3.2.4	The multipole description of the charge density of aspherical atoms	59
3.2.5	Aspherical atom scattering factors	67
3.2.6	The aspherical density functions of the Hirshfeld formalism	70
Chapter 4 Least-Squares Methods and Their Use in Charge Density Analysis 72		
4.1	Least-squares equations	72
4.1.1	Background	72
4.1.2	General formalisms for linear least-squares	72
4.1.3	Explicit expressions for structure factor least-squares	74
4.1.4	Variances and covariances of the least-squares parameter estimates	76
4.1.5	Uncorrelated linear combinations of variables	79
4.2	The least-squares parameters in charge density analysis	79
4.2.1	The parameters in a charge density refinement	79
4.2.2	Parameter restrictions imposed by site and local symmetry and chemical equivalence	80
4.2.3	The scale factor	81
4.3	Physical constraints of the electron density	83
4.3.1	The electroneutrality constraint	83
4.3.2	The Hellmann–Feynman constraint	85
4.4	Joint refinement of X-ray and neutron data	86
4.4.1	The use of complementary information	86
4.4.2	Differences in temperature parameters	86
4.4.3	Relative weighting of the X-ray and neutron data	87
4.4.4	Estimate of the goodness of fit	88

Chapter 5 Fourier Methods and Maximum Entropy Enhancement	90
5.1 General expressions	90
5.1.1 The total density	90
5.1.2 The residual density	92
5.1.3 Least-squares minimization and the residual density	93
5.2 Deformation densities	94
5.2.1 Definition of the deformation density	94
5.2.2 The choice of a model for the reference state	95
5.2.3 The choice of structural parameters in the calculation of the deformation density	101
5.2.4 Combining Fourier and least-squares methods: the model deformation density	105
5.2.5 Phase contributions to the deformation density	109
5.2.6 The variances and covariances of the experimental density	111
5.3 Maximum entropy enhancement of electron densities	115
5.3.1 The mathematics of entropy maximization	115
5.3.2 Application of MEM to single-crystal data on silicon	117
5.3.3 The two-channel maximum entropy method	118
Chapter 6 Space Partitioning and Topological Analysis of the Total Charge Density	121
6.1 Methods of space partitioning	122
6.1.1 The stockholder partitioning concept	122
6.1.2 Space partitioning based on the atom-centered multipole expansion	124
6.1.3 Atomic fragments defined by discrete boundaries	124
6.2 Space partitioning based on the topology of the total electron density	130
6.2.1 The definition of critical points	130
6.2.2 The surface of zero flux	132
6.3 Chemical bonding and the topology of the total electron density distribution	134
6.3.1 The Laplacian of the electron density	134
6.3.2 Classification of bonds based on the topology of the electron density	136
6.3.3 Topological analysis of experimental densities	139
Chapter 7 The Electrostatic Moments of a Charge Distribution	142
7.1 Moments of a charge distribution	143
7.1.1 Definitions	143
7.1.2 The origin dependence of the electrostatic moments	145
7.2 Electrostatic moments from diffraction data	147
7.2.1 Atomic electrostatic moments in terms of the parameters of the multipole formalism	147
7.2.2 Molecular moments as a sum over the pseudoatom moments	149

x Contents

7.2.3	The electrostatic moments of the deformation density	149
7.2.4	Electrostatic moments of a subvolume of space by Fourier summation	151
7.2.5	Error analysis of diffraction moments	154
7.3	Discussion of experimental results	155
7.3.1	A compilation of X-ray electrostatic moments	155
7.3.2	Dipole moments	160
7.3.3	Second moments and quadrupole moments	163
Chapter 8 X-ray Diffraction and the Electrostatic Potential 165		
8.1	Definitions and units	166
8.1.1	Definition of the electrostatic potential	166
8.1.2	The electric field	167
8.1.3	The electric field gradient	167
8.1.4	Units	168
8.2	Evaluation of the electrostatic potential and its derivatives in reciprocal space	168
8.2.1	The electrostatic potential by Fourier summation of the structure factors	168
8.2.2	The $\Phi(0)$ term in the potential summation	170
8.2.3	The electric field and the electric field gradient by direct Fourier summation of the structure factors	172
8.2.4	Application of the ΔF summation to the electrostatic potential in L-alanine	174
8.3	Evaluation of the electrostatic functions in direct space	174
8.3.1	Basic expressions	174
8.3.2	Analytical evaluation of the electrostatic properties due to the spherical components of the charge density	177
8.3.3	Electrostatic properties and the multipole expansion	177
8.4	Comparison of diffraction results with theory and other experimental values	181
8.4.1	The comparison of experimental and theoretical potentials	181
8.4.2	The relation between the electrostatic potential at the nuclear position, the 1s binding energy and the net atomic charge	183
8.4.3	The electric field gradient at the nuclear position	184
8.5	The electrostatic potential outside a charge distribution	186
8.5.1	The electrostatic potential outside a charge distribution in terms of the multipole moments	186
8.5.2	Net atomic charges reproducing the electrostatic potential	186
Chapter 9 The Electron Density and the Lattice Energy of Crystals 192		
9.1	The total energy of a system	192
9.2	Density functional expressions for the energy	192

- 9.2.1 The Hohenberg–Kohn theorem 192
- 9.2.2 Density functional expressions 193
- 9.2.3 The total energy as a function of the electrostatic potential at the nuclear position 194
- 9.3 The cohesive energy of ionic crystals 195
 - 9.3.1 The point-charge model 195
 - 9.3.2 Fourier series for the total electrostatic energy 196
 - 9.3.3 The accelerated convergence method and the electrostatic potential in a point-charge crystal 196
 - 9.3.4 The lattice energy of a crystal consisting of spherical ions 198
 - 9.3.5 Application to the lattice energy of alkali halides 200
- 9.4 The cohesive energy of molecular crystals 203
 - 9.4.1 Molecular interactions 203
 - 9.4.2 Interactions between molecules in crystals 206
 - 9.4.3 Expressions for the evaluation of the electrostatic contribution to the lattice energy of molecular crystals 206
 - 9.4.4 Calculated lattice energies of molecular crystals 208
- Chapter 10 Charge Density Studies of Transition Metal Compounds 211
 - 10.1 The study of transition metal complexes 211
 - 10.2 On the electronic structure of transition metal atoms 212
 - 10.2.1 Crystal field splitting of *d* orbitals 212
 - 10.2.2 Effect of covalency on the orbital populations 214
 - 10.2.3 The relation between the occupancies of transition-metal valence orbitals and the multipole population parameters 216
 - 10.3 The electric field gradient at the nucleus of a transition metal atom 220
 - 10.3.1 Electric field gradient expressions for transition metal elements 220
 - 10.3.2 Comparison with results from Mössbauer spectroscopy 221
 - 10.4 Electron density studies of octahedral and distorted octahedral complexes 227
 - 10.4.1 Complexes with CO, CN, and NH₃ ligands 227
 - 10.4.2 First-row transition metal sulfides 228
 - 10.5 Electron density studies of iron(II) porphyrins 230
 - 10.5.1 The electronic structure of iron(II) tetraphenyl porphyrins 230
 - 10.5.2 Experimental results for iron porphyrins and comparison with theory 230
 - 10.6 The electron density in metal–metal bonds of transition metal complexes 238
 - 10.6.1 Metal–metal bonding 238
 - 10.6.2 Bonding between chromium atoms 238
 - 10.6.3 Mn–Mn and Fe–Fe bonding 240
 - 10.7 Anharmonic thermal motion and the bonding anisotropy of transition metal complexes 241

- 10.7.1 Atomic asphericity and anharmonic thermal motion 241
- 10.7.2 A model study on theoretical structure factors of $\text{Fe}(\text{H}_2\text{O})_6$ 242
- 10.7.3 An experimental example: anharmonic refinement of bis(pyridine) (*meso*-tetraphenylporphinato)iron(II) 244

Chapter 11 The Charge Density in Extended Solids 247

- 11.1 Covalently bonded extended solids 248
 - 11.1.1 Silicon 248
 - 11.1.2 Charge density studies of silicates 253
- 11.2 Metallic solids 257
 - 11.2.1 Specific aspects of metals 257
 - 11.2.2 The charge density in beryllium metal 258
 - 11.2.3 The charge density in vanadium and chromium 261
 - 11.2.4 The charge density in copper 264
 - 11.2.5 Intermetallic compounds and the critical-voltage electron diffraction method 265
- 11.3 Ionic solids 268
 - 11.3.1 Do completely ionic solids exist? 268

Chapter 12 Electron Density Studies of Molecular Crystals 271

- 12.1 Why molecular crystals? 271
 - 12.1.1 The importance of molecular crystals 271
 - 12.1.2 The suitability factor 272
 - 12.1.3 The oxalic acid project 273
- 12.2 Transferability of charge density parameters among related atoms 273
- 12.3 Selected studies of molecular crystals 277
 - 12.3.1 Bent bonds 277
 - 12.3.2 Molecular crystals with nonlinear optical properties 282
 - 12.3.3 The effect of intermolecular interactions on the charge density 283
- 12.4 Concluding remarks 287

Appendix A Tensor Notation 288

Appendix B Symmetry and Symmetry Restrictions 290

Appendix C The 50% Probability Ellipsoid 295

Appendix D Spherical Harmonic Functions 297

Appendix E Products of Spherical Harmonic Functions 307

Appendix F Energy-Optimized Single- ζ Slater Values for Subshells of Isolated Atoms 311

Appendix G Fourier–Bessel Transforms 313

Appendix H Evaluation of the Integrals $A_{N,l_1,l_2,k}(Z, R)$ Occurring in the Expression for the Peripheral Contribution to the Electrostatic Properties 315

Appendix I	The Matrix \mathbf{M}^{-1} Relating d -Orbital Occupancies P_{ij} to Multipole Populations P_{imp}	317
Appendix J	The Interaction Between Two Nonoverlapping Charge Distributions	318
Appendix K	Conversion Factors	320
Appendix L	Selected Exercises	320
